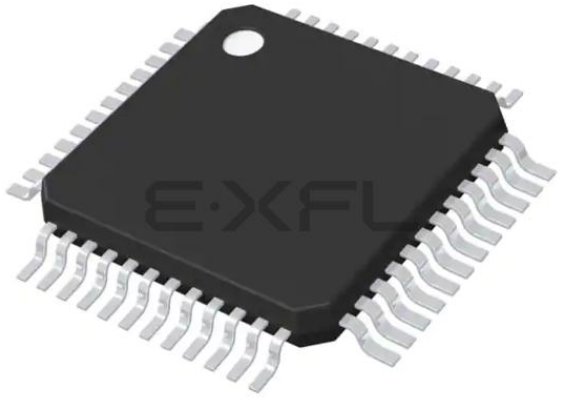
Infineon Technologies - XC886C6FFA5VACFXUMA1 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Discontinued at Digi-Key
Core Processor	XC800
Core Size	8-Bit
Speed	24MHz
Connectivity	CANbus, SSI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	34
Program Memory Size	24KB (24K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.75K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	PG-TQFP-48
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xc886c6ffa5vacfxuma1

2.4 Pin Definitions and Functions

The functions and default states of the XC886/888 external pins are provided in **Table 3**.

Table 3 Pin Definitions and Functions

Symbol	Pin Number (TQFP-48/64)	Type	Reset State	Function
P0		I/O		**Port 0** Port 0 is an 8-bit bidirectional general purpose I/O port. It can be used as alternate functions for the JTAG, CCU6, UART, UART1, Timer 2, Timer 21, MultiCAN and SSC.
P0.0	11/17		Hi-Z	TCK_0 JTAG Clock Input T12HR_1 CCU6 Timer 12 Hardware Run Input CC61_1 Input/Output of Capture/Compare channel 1 CLKOUT_0 Clock Output RXDO_1 UART Transmit Data Output
P0.1	13/21		Hi-Z	TDI_0 JTAG Serial Data Input T13HR_1 CCU6 Timer 13 Hardware Run Input RXD_1 UART Receive Data Input RXDC1_0 MultiCAN Node 1 Receiver Input COUT61_1 Output of Capture/Compare channel 1 EXF2_1 Timer 2 External Flag Output
P0.2	12/18		PU	$\overline{\text{CTRAP}}$_2 CCU6 Trap Input TDO_0 JTAG Serial Data Output TXD_1 UART Transmit Data Output/Clock Output TXDC1_0 MultiCAN Node 1 Transmitter Output
P0.3	48/63		Hi-Z	SCK_1 SSC Clock Input/Output COUT63_1 Output of Capture/Compare channel 3 RXDO1_0 UART1 Transmit Data Output

Table 3 Pin Definitions and Functions (cont'd)

Symbol	Pin Number (TQFP-48/64)	Type	Reset State	Function
P3		I/O		**Port 3** Port 3 is an 8-bit bidirectional general purpose I/O port. It can be used as alternate functions for CCU6, UART1, Timer 21 and MultiCAN.
P3.0	35/43		Hi-Z	CCPOS1_2 CCU6 Hall Input 1 CC60_0 Input/Output of Capture/Compare channel 0 RXDO1_1 UART1 Transmit Data Output
P3.1	36/44		Hi-Z	CCPOS0_2 CCU6 Hall Input 0 CC61_2 Input/Output of Capture/Compare channel 1 COUT60_0 Output of Capture/Compare channel 0 TXD1_1 UART1 Transmit Data Output/Clock Output
P3.2	37/49		Hi-Z	CCPOS2_2 CCU6 Hall Input 2 RXDC1_1 MultiCAN Node 1 Receiver Input RXD1_1 UART1 Receive Data Input CC61_0 Input/Output of Capture/Compare channel 1
P3.3	38/50		Hi-Z	COUT61_0 Output of Capture/Compare channel 1 TXDC1_1 MultiCAN Node 1 Transmitter Output
P3.4	39/51		Hi-Z	CC62_0 Input/Output of Capture/Compare channel 2 RXDC0_1 MultiCAN Node 0 Receiver Input T2EX1_0 Timer 21 External Trigger Input
P3.5	40/52		Hi-Z	COUT62_0 Output of Capture/Compare channel 2 EXF21_0 Timer 21 External Flag Output TXDC0_1 MultiCAN Node 0 Transmitter Output
P3.6	33/41		PD	$\overline{\text{CTRAP\_0}}$ CCU6 Trap Input

3 Functional Description

Chapter 3 provides an overview of the XC886/888 functional description.

3.1 Processor Architecture

The XC886/888 is based on a high-performance 8-bit Central Processing Unit (CPU) that is compatible with the standard 8051 processor. While the standard 8051 processor is designed around a 12-clock machine cycle, the XC886/888 CPU uses a 2-clock machine cycle. This allows fast access to ROM or RAM memories without wait state. Access to the Flash memory, however, requires an additional wait state (one machine cycle). The instruction set consists of 45% one-byte, 41% two-byte and 14% three-byte instructions.

The XC886/888 CPU provides a range of debugging features, including basic stop/start, single-step execution, breakpoint support and read/write access to the data memory, program memory and Special Function Registers (SFRs).

Figure 6 shows the CPU functional blocks.

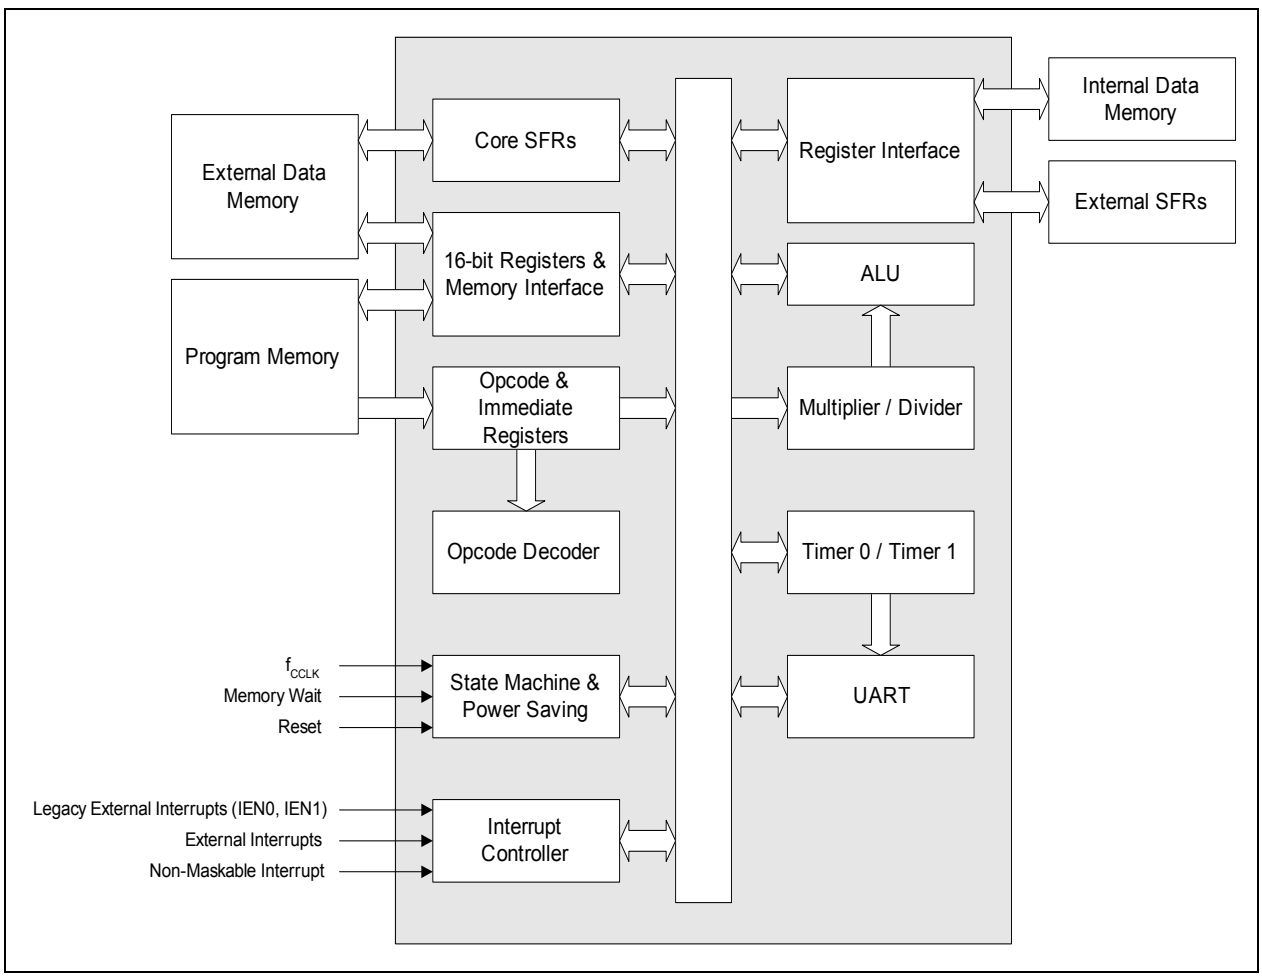


Figure 6 CPU Block Diagram

3.2 Memory Organization

The XC886/888 CPU operates in the following five address spaces:

- 12 Kbytes of Boot ROM program memory
- 256 bytes of internal RAM data memory
- 1.5 Kbytes of XRAM memory
  (XRAM can be read/written as program memory or external data memory)
- A 128-byte Special Function Register area
- 24/32 Kbytes of Flash program memory (Flash devices); or
  24/32 Kbytes of ROM program memory, with additional 4 Kbytes of Flash
  (ROM devices)

Figure 7 illustrates the memory address spaces of the 32-Kbyte Flash devices. For the 24-Kbyte Flash devices, the shaded banks are not available.

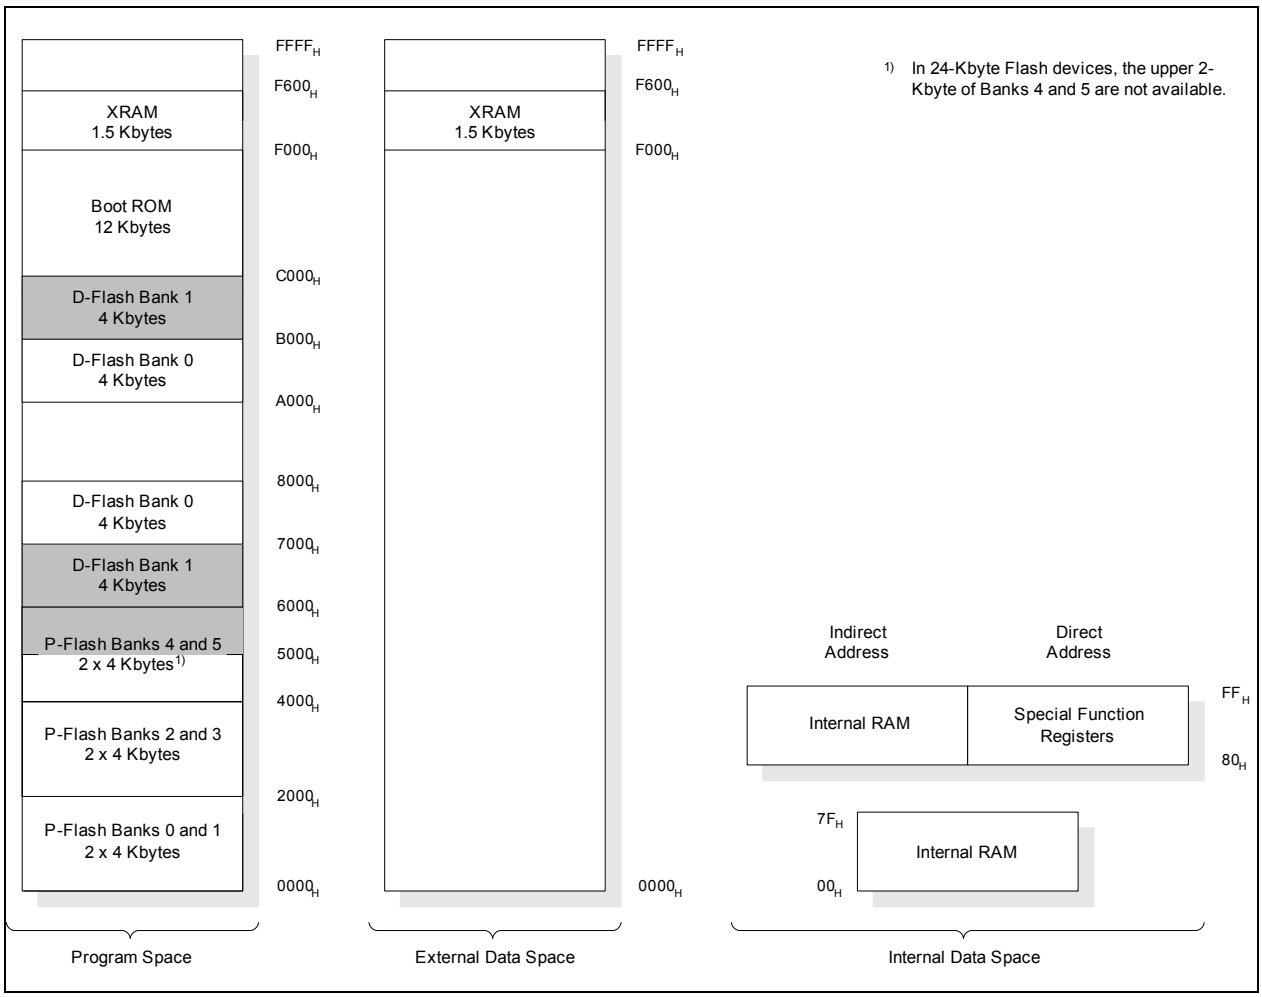

Figure 7 Memory Map of XC886/888 Flash Device

For both 24-Kbyte and 32-Kbyte ROM devices, the last four bytes of the ROM from $7FFC_H$ to $7FFF_H$ are reserved for the ROM signature and cannot be used to store user

Table 4 Flash Protection Modes (cont'd)

Flash Protection	Without hardware protection	With hardware protection	
P-Flash program and erase	Possible	Not possible	Not possible
D-Flash contents can be read by	Read instructions in any program memory	Read instructions in any program memory	Read instructions in the P-Flash or D-Flash
External access to D-Flash	Not possible	Not possible	Not possible
D-Flash program	Possible	Possible	Not possible
D-Flash erase	Possible	Possible, on condition that bit DFLASHEN in register MISC_CON is set to 1 prior to each erase operation	Not possible

BSL mode 6, which is used for enabling Flash protection, can also be used for disabling Flash protection. Here, the programmed password must be provided by the user. A password match triggers an automatic erase of the protected P-Flash and D-Flash contents, including the programmed password. The Flash protection is then disabled upon the next reset.

For the ROM device, the ROM is protected at all times and BSL mode 6 is used only to block external access to the device. However, unlike the Flash device, it is not possible to disable the memory protection of the ROM device. Here, entering BSL mode 6 will result in a protection error.

Note: If ROM read-out protection is enabled, only read instructions in the ROM memory can target the ROM contents.

Although no protection scheme can be considered infallible, the XC886/888 memory protection strategy provides a very high level of protection for a general purpose microcontroller.

3.3 Flash Memory

The Flash memory provides an embedded user-programmable non-volatile memory, allowing fast and reliable storage of user code and data. It is operated from a single 2.5 V supply from the Embedded Voltage Regulator (EVR) and does not require additional programming or erasing voltage. The sectorization of the Flash memory allows each sector to be erased independently.

Features

- In-System Programming (ISP) via UART
- In-Application Programming (IAP)
- Error Correction Code (ECC) for dynamic correction of single-bit errors
- Background program and erase operations for CPU load minimization
- Support for aborting erase operation
- Minimum program width[1] of 32-byte for D-Flash and 64-byte for P-Flash
- 1-sector minimum erase width
- 1-byte read access
- Flash is delivered in erased state (read all zeros)
- Operating supply voltage: 2.5 V ± 7.5 %
- Read access time: 3 × t_{CCLK} = 125 ns[2]
- Program time: 248256 / f_{SYS} = 2.6 ms[3]
- Erase time: 9807360 / f_{SYS} = 102 ms[3]

1) P-Flash: 64-byte wordline can only be programmed once, i.e., one gate disturb allowed.
D-Flash: 32-byte wordline can be programmed twice, i.e., two gate disturbs allowed.

2) Values shown here are typical values. f_{sys} = 96 MHz ± 7.5% (f_{CCLK} = 24 MHz ± 7.5 %) is the maximum frequency range for Flash read access.

3) Values shown here are typical values. f_{sys} = 96 MHz ± 7.5% is the only frequency range for Flash programming and erasing. f_{sysmin} is used for obtaining the worst case timing.

3.4 Interrupt System

The XC800 Core supports one non-maskable interrupt (NMI) and 14 maskable interrupt requests. In addition to the standard interrupt functions supported by the core, e.g., configurable interrupt priority and interrupt masking, the XC886/888 interrupt system provides extended interrupt support capabilities such as the mapping of each interrupt vector to several interrupt sources to increase the number of interrupt sources supported, and additional status registers for detecting and determining the interrupt source.

3.4.1 Interrupt Source

Figure 13 to **Figure 17** give a general overview of the interrupt sources and nodes, and their corresponding control and status flags.

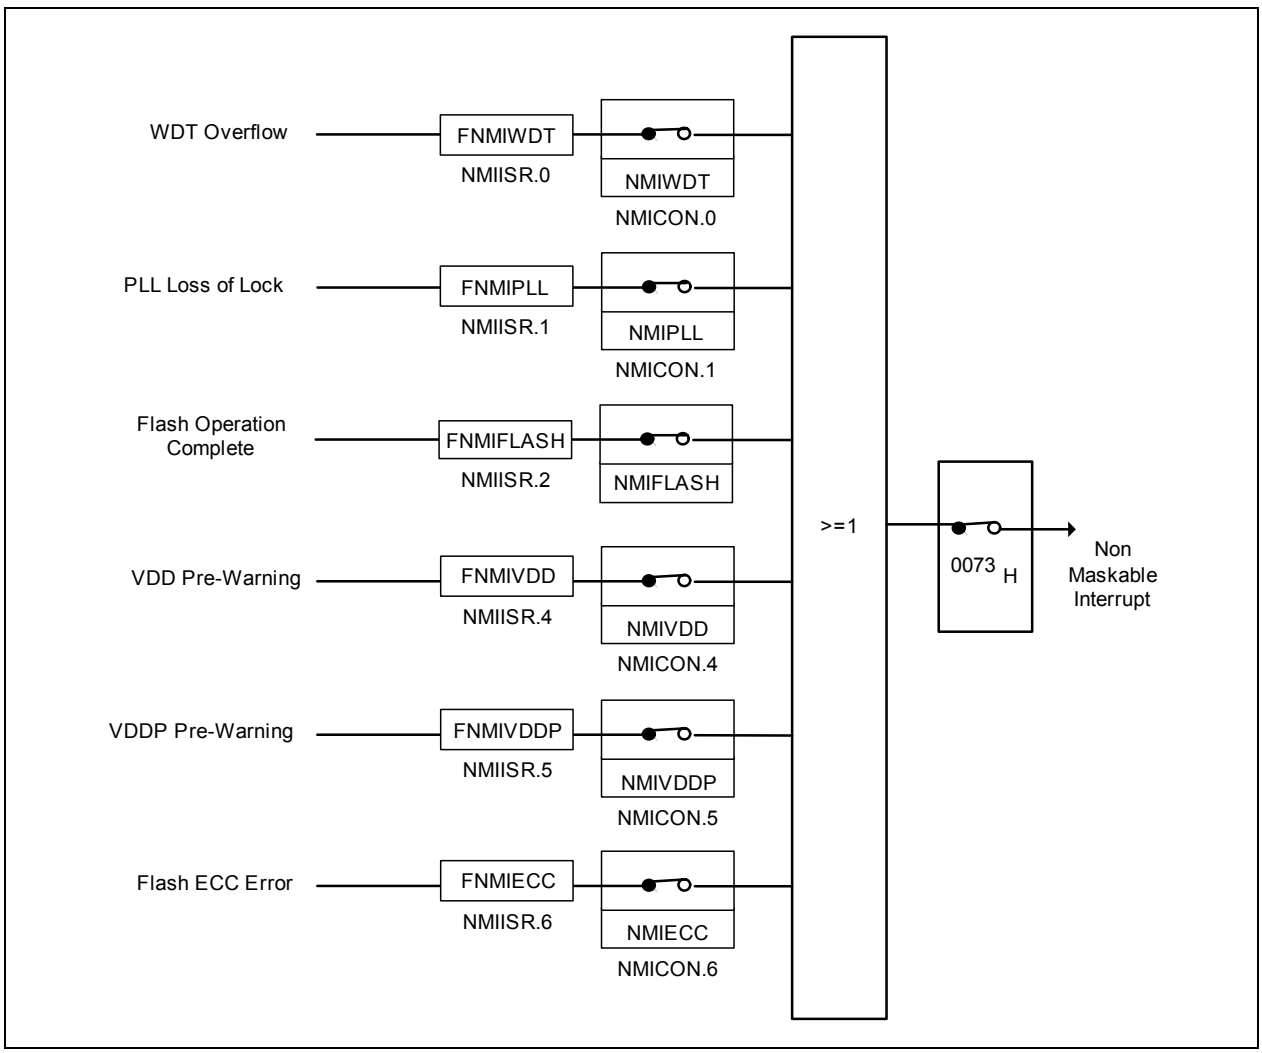

Figure 13 Non-Maskable Interrupt Request Sources

3.4.2 Interrupt Source and Vector

Each interrupt event source has an associated interrupt vector address for the interrupt node it belongs to. This vector is accessed to service the corresponding interrupt node request. The interrupt service of each interrupt source can be individually enabled or disabled via an enable bit. The assignment of the XC886/888 interrupt sources to the interrupt vector address and the corresponding interrupt node enable bits are summarized in **Table 20**.

Table 20 Interrupt Vector Addresses

Interrupt Source	Vector Address	Assignment for XC886/888	Enable Bit	SFR

		MultiCAN Node 7		

3.5 Parallel Ports

The XC886 has 34 port pins organized into five parallel ports, Port 0 (P0) to Port 4 (P4), while the XC888 has 48 port pins organized into six parallel ports, Port 0 (P0) to Port 5 (P5). Each pin has a pair of internal pull-up and pull-down devices that can be individually enabled or disabled. Ports P0, P1, P3, P4 and P5 are bidirectional and can be used as general purpose input/output (GPIO) or to perform alternate input/output functions for the on-chip peripherals. When configured as an output, the open drain mode can be selected. Port P2 is an input-only port, providing general purpose input functions, alternate input functions for the on-chip peripherals, and also analog inputs for the Analog-to-Digital Converter (ADC).

Bidirectional Port Features

- Configurable pin direction
- Configurable pull-up/pull-down devices
- Configurable open drain mode
- Transfer of data through digital inputs and outputs (general purpose I/O)
- Alternate input/output for on-chip peripherals

Input Port Features

- Configurable input driver
- Configurable pull-up/pull-down devices
- Receive of data through digital input (general purpose input)
- Alternate input for on-chip peripherals
- Analog input for ADC module

The following formulas calculate the final baud rate without and with the fractional divider respectively:

$$\text{baud rate} = \frac{f_{PCLK}}{16 \times 2^{BRPRE} \times (BR\_VALUE + 1)} \quad \text{where } 2^{BRPRE} \times (BR\_VALUE + 1) > 1 \tag{3.5}$$

$$\text{baud rate} = \frac{f_{PCLK}}{16 \times 2^{BRPRE} \times (BR\_VALUE + 1)} \times \frac{STEP}{256} \tag{3.6}$$

The maximum baud rate that can be generated is limited to $f_{PCLK}/32$. Hence, for a module clock of 24 MHz, the maximum achievable baud rate is 0.75 MBaud.

Standard LIN protocol can support a maximum baud rate of 20 kHz, the baud rate accuracy is not critical and the fractional divider can be disabled. Only the prescaler is used for auto baud rate calculation. For LIN fast mode, which supports the baud rate of 20 kHz to 115.2 kHz, the higher baud rates require the use of the fractional divider for greater accuracy.

Table 30 lists the various commonly used baud rates with their corresponding parameter settings and deviation errors. The fractional divider is disabled and a module clock of 24 MHz is used.

Table 30 Typical Baud rates for UART with Fractional Divider disabled

Baud rate	Prescaling Factor (2BRPRE)	Reload Value (BR_VALUE + 1)	Deviation Error
19.2 kBaud	1 (BRPRE=000_B)	78 ($4E_H$)	0.17 %
9600 Baud	1 (BRPRE=000_B)	156 ($9C_H$)	0.17 %
4800 Baud	2 (BRPRE=001_B)	156 ($9C_H$)	0.17 %
2400 Baud	4 (BRPRE=010_B)	156 ($9C_H$)	0.17 %

The fractional divider allows baud rates of higher accuracy (lower deviation error) to be generated. **Table 31** lists the resulting deviation errors from generating a baud rate of 115.2 kHz, using different module clock frequencies. The fractional divider is enabled (fractional divider mode) and the corresponding parameter settings are shown.

3.17 Timer 0 and Timer 1

Timer 0 and Timer 1 can function as both timers or counters. When functioning as a timer, Timer 0 and Timer 1 are incremented every machine cycle, i.e. every 2 input clocks (or 2 PCLKs). When functioning as a counter, Timer 0 and Timer 1 are incremented in response to a 1-to-0 transition (falling edge) at their respective external input pins, T0 or T1.

Timer 0 and 1 are fully compatible and can be configured in four different operating modes for use in a variety of applications, see **Table 32**. In modes 0, 1 and 2, the two timers operate independently, but in mode 3, their functions are specialized.

Table 32 Timer 0 and Timer 1 Modes

Mode	Operation
0	**13-bit timer** The timer is essentially an 8-bit counter with a divide-by-32 prescaler. This mode is included solely for compatibility with Intel 8048 devices.
1	**16-bit timer** The timer registers, TLx and THx, are concatenated to form a 16-bit counter.
2	**8-bit timer with auto-reload** The timer register TLx is reloaded with a user-defined 8-bit value in THx upon overflow.
3	**Timer 0 operates as two 8-bit timers** The timer registers, TL0 and TH0, operate as two separate 8-bit counters. Timer 1 is halted and retains its count even if enabled.

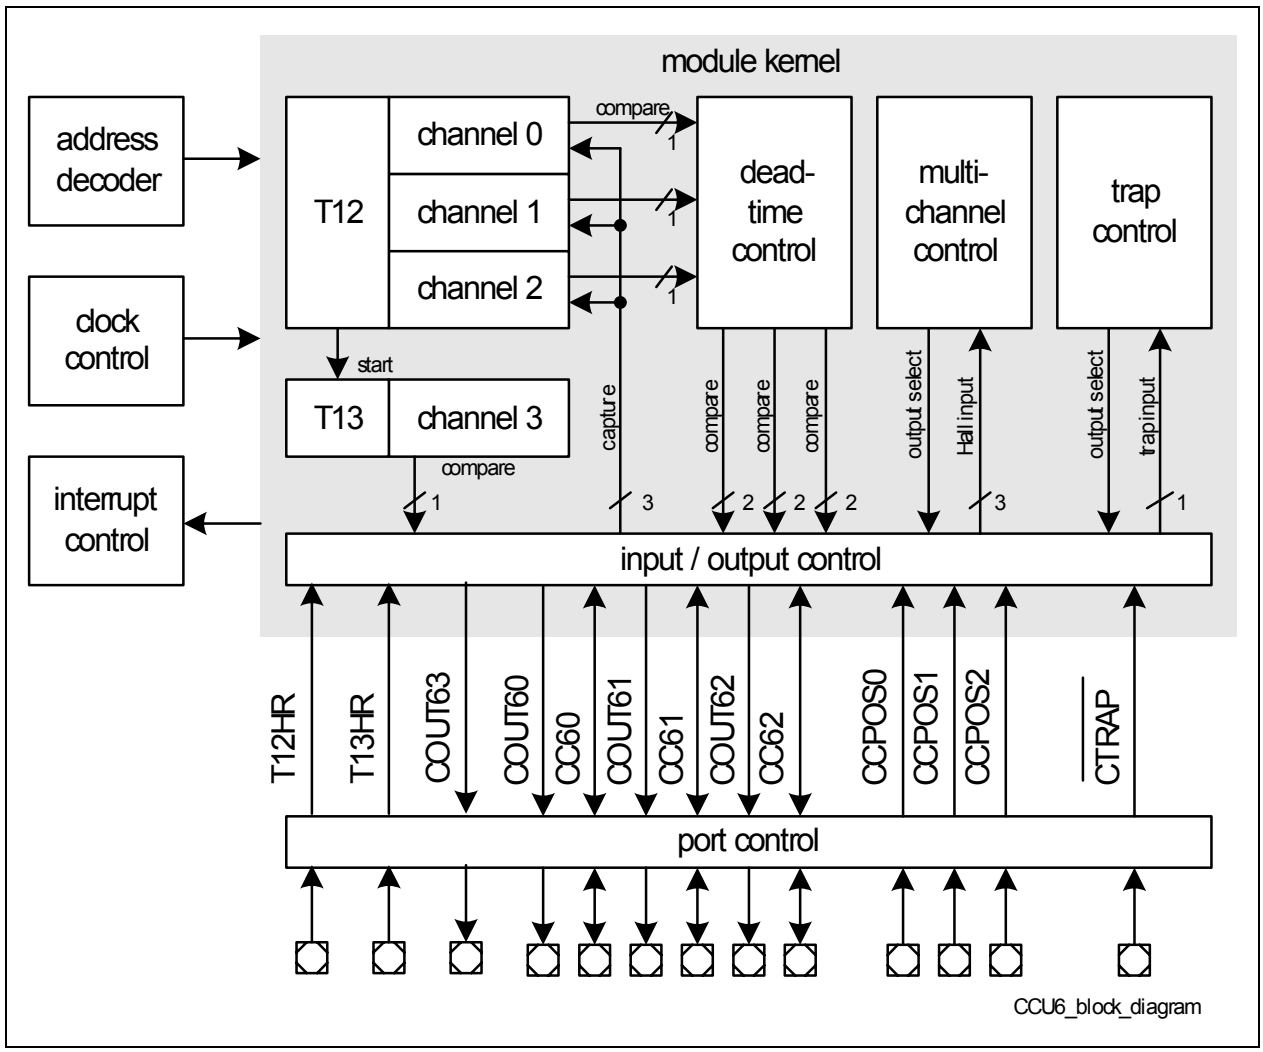

Figure 33 CCU6 Block Diagram

3.21 Analog-to-Digital Converter

The XC886/888 includes a high-performance 10-bit Analog-to-Digital Converter (ADC) with eight multiplexed analog input channels. The ADC uses a successive approximation technique to convert the analog voltage levels from up to eight different sources. The analog input channels of the ADC are available at Port 2.

Features

- Successive approximation
- 8-bit or 10-bit resolution
  (TUE of ± 1 LSB and ± 2 LSB, respectively)
- Eight analog channels
- Four independent result registers
- Result data protection for slow CPU access
  (wait-for-read mode)
- Single conversion mode
- Autoscan functionality
- Limit checking for conversion results
- Data reduction filter
  (accumulation of up to 2 conversion results)
- Two independent conversion request sources with programmable priority
- Selectable conversion request trigger
- Flexible interrupt generation with configurable service nodes
- Programmable sample time
- Programmable clock divider
- Cancel/restart feature for running conversions
- Integrated sample and hold circuitry
- Compensation of offset errors
- Low power modes

3.21.1 ADC Clocking Scheme

A common module clock f_{ADC} generates the various clock signals used by the analog and digital parts of the ADC module:

- f_{ADCA} is input clock for the analog part.
- f_{ADCI} is internal clock for the analog part (defines the time base for conversion length and the sample time). This clock is generated internally in the analog part, based on the input clock f_{ADCA} to generate a correct duty cycle for the analog components.
- f_{ADCD} is input clock for the digital part.

The internal clock for the analog part f_{ADCI} is limited to a maximum frequency of 10 MHz. Therefore, the ADC clock prescaler must be programmed to a value that ensures f_{ADCI} does not exceed 10 MHz. The prescaler ratio is selected by bit field CTC in register

3.22 On-Chip Debug Support

The On-Chip Debug Support (OCDS) provides the basic functionality required for the software development and debugging of XC800-based systems.

The OCDS design is based on these principles:

- Use the built-in debug functionality of the XC800 Core
- Add a minimum of hardware overhead
- Provide support for most of the operations by a Monitor Program
- Use standard interfaces to communicate with the Host (a Debugger)

Features

- Set breakpoints on instruction address and on address range within the Program Memory
- Set breakpoints on internal RAM address range
- Support unlimited software breakpoints in Flash/RAM code region
- Process external breaks via JTAG and upon activating a dedicated pin
- Step through the program code

The OCDS functional blocks are shown in **Figure 37**. The Monitor Mode Control (MMC) block at the center of OCDS system brings together control signals and supports the overall functionality. The MMC communicates with the XC800 Core, primarily via the Debug Interface, and also receives reset and clock signals.

After processing memory address and control signals from the core, the MMC provides proper access to the dedicated extra-memories: a Monitor ROM (holding the code) and a Monitor RAM (for work-data and Monitor-stack).

The OCDS system is accessed through the JTAG[1)], which is an interface dedicated exclusively for testing and debugging activities and is not normally used in an application. The dedicated MBC pin is used for external configuration and debugging control.

Note: All the debug functionality described here can normally be used only after XC886/888 has been started in OCDS mode.

1) The pins of the JTAG port can be assigned to either the primary port (Port 0) or either of the secondary ports (Ports 1 and 2/Port 5).
User must set the JTAG pins (TCK and TDI) as input during connection with the OCDS system.

Table 42 Power Down Current (Operating Conditions apply; V_{DDP} = 5V range)

Parameter	Symbol	Limit Values		Unit	Test Condition
		typ.[1]	max.[2]		
V_{DDP} = 5V Range					
Power-Down Mode	I_{PDP}	1	10	µA	T_A = + 25 °C[3][4]
		-	30	µA	T_A = + 85 °C[4][5]

1) The typical I_{PDP} values are measured at V_{DDP} = 5.0 V.

2) The maximum I_{PDP} values are measured at V_{DDP} = 5.5 V.

3) I_{PDP} has a maximum value of 200 µA at T_A = + 125 °C.

4) I_{PDP} is measured with: $\overline{\text{RESET}}$ = V_{DDP}, V_{AGND}= V_{SS}, RXD/INT0 = V_{DDP}; rest of the ports are programmed to be input with either internal pull devices enabled or driven externally to ensure no floating inputs.

5) Not subjected to production test, verified by design/characterization.

4.3.4 On-Chip Oscillator Characteristics

Table 47 provides the characteristics of the on-chip oscillator in the XC886/888.

Table 47 On-chip Oscillator Characteristics (Operating Conditions apply)

Parameter	Symbol		Limit Values			Unit	Test Conditions
			min.	typ.	max.		
Nominal frequency	f_{NOM}	CC	9.36	9.6	9.84	MHz	under nominal conditions[1]
Long term frequency deviation	Δf_{LT}	CC	-5.0	–	5.0	%	with respect to f_{NOM}, over lifetime and temperature (-10°C to 125°C), for one given device after trimming
			-6.0	–	0	%	with respect to f_{NOM}, over lifetime and temperature (-40°C to -10°C), for one given device after trimming
Short term frequency deviation	Δf_{ST}	CC	-1.0	–	1.0	%	within one LIN message (<10 ms .... 100 ms)

1) Nominal condition: V_{DDC} = 2.5 V, T_A = + 25°C.
