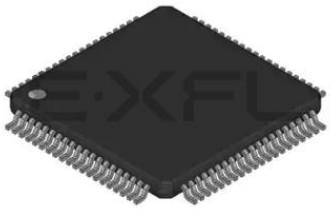
Infineon Technologies - XC886LM6FFA5VACFXUMA1 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Discontinued at Digi-Key
Core Processor	XC800
Core Size	8-Bit
Speed	24MHz
Connectivity	LINbus, SSI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	34
Program Memory Size	24KB (24K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.75K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	-
Package / Case	-
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xc886lm6ffa5vacfxuma1

Table 3 Pin Definitions and Functions (cont'd)

Symbol	Pin Number (TQFP-48/64)	Type	Reset State	Function
P2		I		**Port 2** Port 2 is an 8-bit general purpose input-only port. It can be used as alternate functions for the digital inputs of the JTAG and CCU6. It is also used as the analog inputs for the ADC.
P2.0	14/22		Hi-Z	CCPOS0_0 CCU6 Hall Input 0 EXINT1_0 External Interrupt Input 1 T12HR_2 CCU6 Timer 12 Hardware Run Input TCK_1 JTAG Clock Input CC61_3 Input of Capture/Compare channel 1 AN0 Analog Input 0
P2.1	15/23		Hi-Z	CCPOS1_0 CCU6 Hall Input 1 EXINT2_0 External Interrupt Input 2 T13HR_2 CCU6 Timer 13 Hardware Run Input TDI_1 JTAG Serial Data Input CC62_3 Input of Capture/Compare channel 2 AN1 Analog Input 1
P2.2	16/24		Hi-Z	CCPOS2_0 CCU6 Hall Input 2 CTRAP_1 CCU6 Trap Input CC60_3 Input of Capture/Compare channel 0 AN2 Analog Input 2
P2.3	19/27		Hi-Z	AN3 Analog Input 3
P2.4	20/28		Hi-Z	AN4 Analog Input 4
P2.5	21/29		Hi-Z	AN5 Analog Input 5
P2.6	22/30		Hi-Z	AN6 Analog Input 6
P2.7	25/33		Hi-Z	AN7 Analog Input 7

Table 3 Pin Definitions and Functions (cont'd)

Symbol	Pin Number (TQFP-48/64)	Type	Reset State	Function	
P5		I/O		**Port 5** Port 5 is an 8-bit bidirectional general purpose I/O port. It can be used as alternate functions for UART, UART1 and JTAG.	
P5.0	–/8		PU	EXINT1_1	External Interrupt Input 1
P5.1	–/9		PU	EXINT2_1	External Interrupt Input 2
P5.2	–/12		PU	RXD_2	UART Receive Data Input
P5.3	–/13		PU	TXD_2	UART Transmit Data Output/Clock Output
P5.4	–/14		PU	RXDO_2	UART Transmit Data Output
P5.5	–/15		PU	TDO_2 TXD1_2	JTAG Serial Data Output UART1 Transmit Data Output/ Clock Output
P5.6	–/19		PU	TCK_2 RXDO1_2	JTAG Clock Input UART1 Transmit Data Output
P5.7	–/20		PU	TDI_2 RXD1_2	JTAG Serial Data Input UART1 Receive Data Input

3 Functional Description

Chapter 3 provides an overview of the XC886/888 functional description.

3.1 Processor Architecture

The XC886/888 is based on a high-performance 8-bit Central Processing Unit (CPU) that is compatible with the standard 8051 processor. While the standard 8051 processor is designed around a 12-clock machine cycle, the XC886/888 CPU uses a 2-clock machine cycle. This allows fast access to ROM or RAM memories without wait state. Access to the Flash memory, however, requires an additional wait state (one machine cycle). The instruction set consists of 45% one-byte, 41% two-byte and 14% three-byte instructions.

The XC886/888 CPU provides a range of debugging features, including basic stop/start, single-step execution, breakpoint support and read/write access to the data memory, program memory and Special Function Registers (SFRs).

Figure 6 shows the CPU functional blocks.

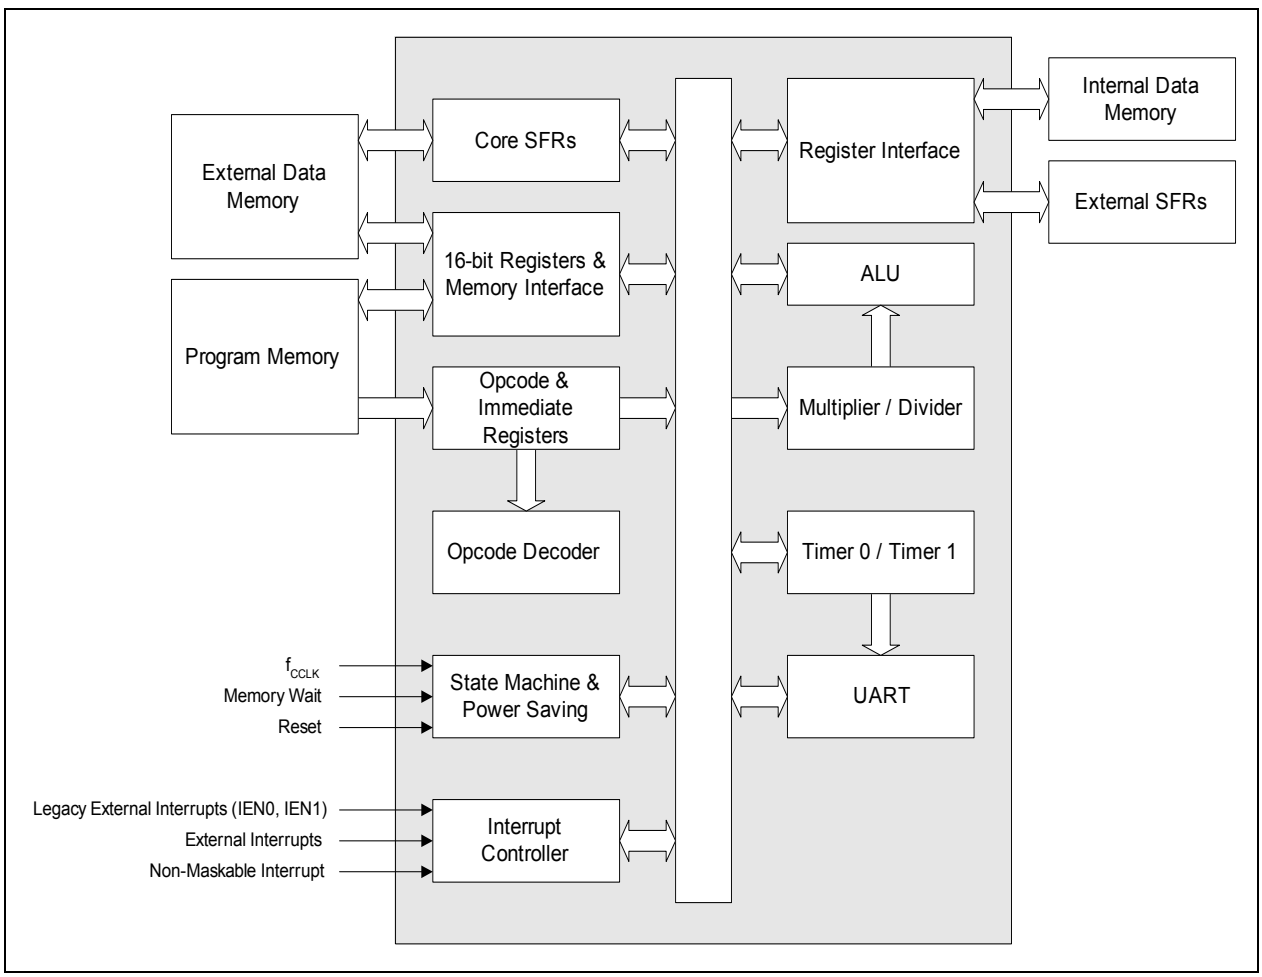


Figure 6 CPU Block Diagram

Table 4 Flash Protection Modes (cont'd)

Flash Protection	Without hardware protection	With hardware protection	
P-Flash program and erase	Possible	Not possible	Not possible
D-Flash contents can be read by	Read instructions in any program memory	Read instructions in any program memory	Read instructions in the P-Flash or D-Flash
External access to D-Flash	Not possible	Not possible	Not possible
D-Flash program	Possible	Possible	Not possible
D-Flash erase	Possible	Possible, on condition that bit DFLASHEN in register MISC_CON is set to 1 prior to each erase operation	Not possible

BSL mode 6, which is used for enabling Flash protection, can also be used for disabling Flash protection. Here, the programmed password must be provided by the user. A password match triggers an automatic erase of the protected P-Flash and D-Flash contents, including the programmed password. The Flash protection is then disabled upon the next reset.

For the ROM device, the ROM is protected at all times and BSL mode 6 is used only to block external access to the device. However, unlike the Flash device, it is not possible to disable the memory protection of the ROM device. Here, entering BSL mode 6 will result in a protection error.

Note: If ROM read-out protection is enabled, only read instructions in the ROM memory can target the ROM contents.

Although no protection scheme can be considered infallible, the XC886/888 memory protection strategy provides a very high level of protection for a general purpose microcontroller.

3.2.2 Special Function Register

The Special Function Registers (SFRs) occupy direct internal data memory space in the range 80_H to FF_H. All registers, except the program counter, reside in the SFR area. The SFRs include pointers and registers that provide an interface between the CPU and the on-chip peripherals. As the 128-SFR range is less than the total number of registers required, address extension mechanisms are required to increase the number of addressable SFRs. The address extension mechanisms include:

- Mapping
- Paging

3.2.2.1 Address Extension by Mapping

Address extension is performed at the system level by mapping. The SFR area is extended into two portions: the standard (non-mapped) SFR area and the mapped SFR area. Each portion supports the same address range 80_H to FF_H, bringing the number of addressable SFRs to 256. The extended address range is not directly controlled by the CPU instruction itself, but is derived from bit RMAP in the system control register SYSCON0 at address $8F_H$. To access SFRs in the mapped area, bit RMAP in SFR SYSCON0 must be set. Alternatively, the SFRs in the standard area can be accessed by clearing bit RMAP. The SFR area can be selected as shown in **Figure 8**.

As long as bit RMAP is set, the mapped SFR area can be accessed. This bit is not cleared automatically by hardware. Thus, before standard/mapped registers are accessed, bit RMAP must be cleared/set, respectively, by software.

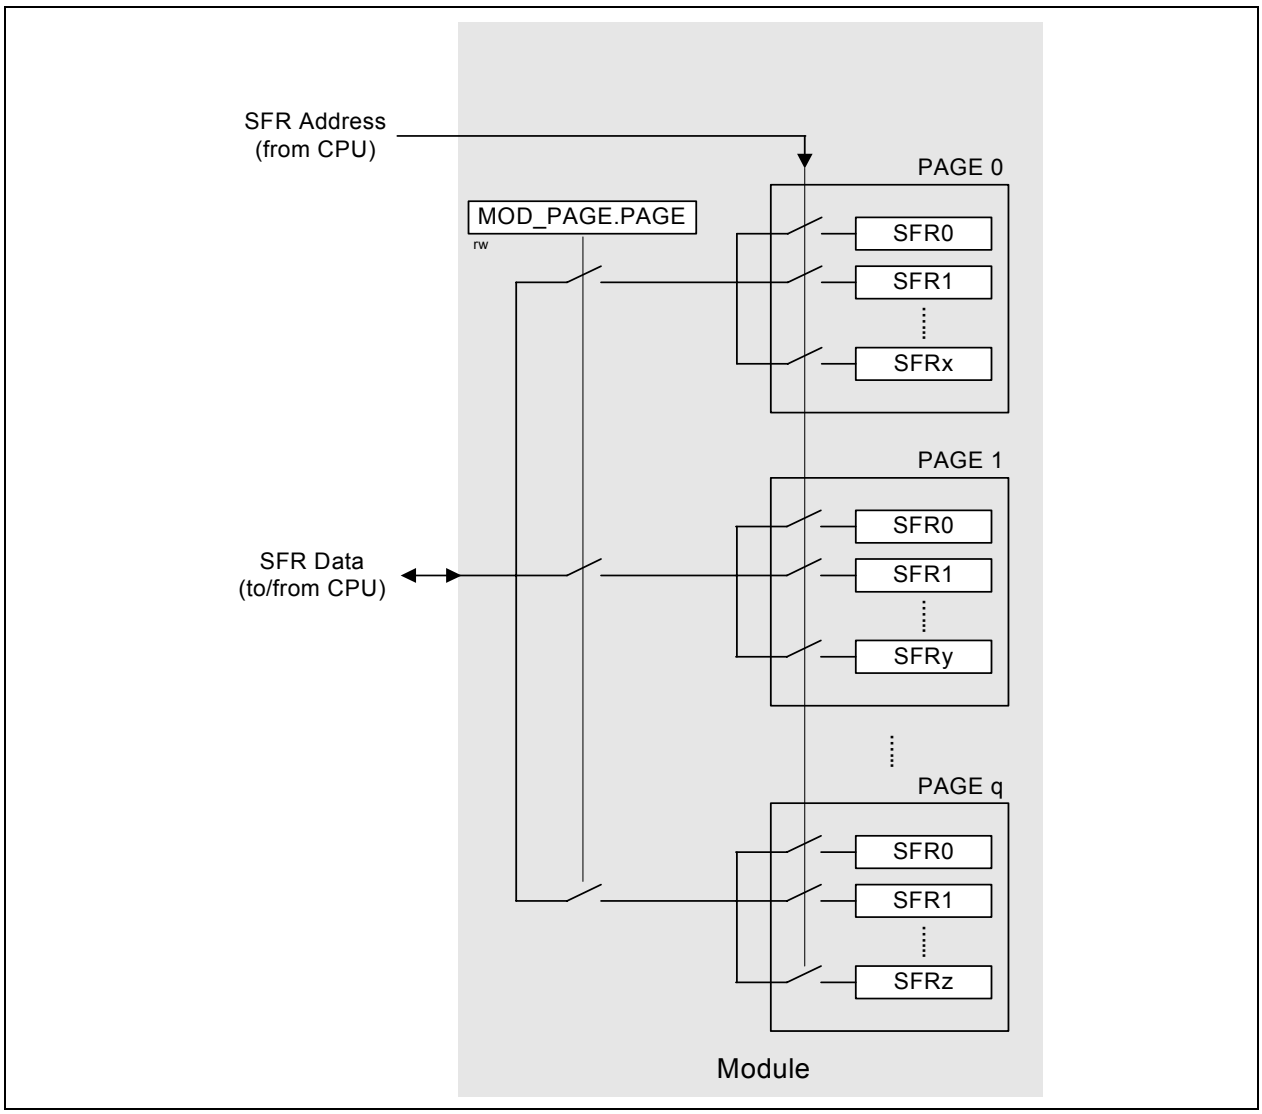

Figure 9 Address Extension by Paging

In order to access a register located in a page different from the actual one, the current page must be exited. This is done by reprogramming the bit field PAGE in the page register. Only then can the desired access be performed.

If an interrupt routine is initiated between the page register access and the module register access, and the interrupt needs to access a register located in another page, the current page setting can be saved, the new one programmed and the old page setting restored. This is possible with the storage fields STx (x = 0 - 3) for the save and restore action of the current page setting. By indicating which storage bit field should be used in parallel with the new page value, a single write operation can:

- Save the contents of PAGE in STx before overwriting with the new value
  (this is done in the beginning of the interrupt routine to save the current page setting and program the new page number); or

3.2.4 XC886/888 Register Overview

The SFRs of the XC886/888 are organized into groups according to their functional units. The contents (bits) of the SFRs are summarized in **Chapter 3.2.4.1** to **Chapter 3.2.4.14**.

Note: The addresses of the bitaddressable SFRs appear in bold typeface.

3.2.4.1 CPU Registers

The CPU SFRs can be accessed in both the standard and mapped memory areas (RMAP = 0 or 1).

Table 5 CPU Register Overview

Addr	Register Name	Bit	7	6	5	4	3	2	1	0
RMAP = 0 or 1										
81_H	**SP** **Reset: 07_H** Stack Pointer Register	Bit Field	SP

3.7.1 Module Reset Behavior

Table 22 lists the functions of the XC886/888 and the various reset types that affect these functions. The symbol "■" signifies that the particular function is reset to its default state.

Table 22 Effect of Reset on Device Functions

Module/ Function	Wake-Up Reset	Watchdog Reset	Hardware Reset	Power-On Reset	Brownout Reset
CPU Core	■	■	■	■	■
Peripherals	■	■	■	■	■
On-Chip Static RAM	Not affected, Reliable	Not affected, Reliable	Not affected, Reliable	Affected, un-reliable	Affected, un-reliable
Oscillator, PLL	■	Not affected	■	■	■
Port Pins	■	■	■	■	■
EVR	The voltage regulator is switched on	Not affected	■	■	■
FLASH	■	■	■	■	■
NMI	Disabled	Disabled	■	■	■

3.7.2 Booting Scheme

When the XC886/888 is reset, it must identify the type of configuration with which to start the different modes once the reset sequence is complete. Thus, boot configuration information that is required for activation of special modes and conditions needs to be applied by the external world through input pins. After power-on reset or hardware reset, the pins MBC, TMS and P0.0 collectively select the different boot options. Table 23 shows the available boot options in the XC886/888.

Table 23 XC886/888 Boot Selection

MBC	TMS	P0.0	Type of Mode	PC Start Value
1	0	X	User Mode[1]; on-chip OSC/PLL non-bypassed	0000_H
0	0	X	BSL Mode; on-chip OSC/PLL non-bypassed[2]	0000_H
0	1	0	OCDS Mode; on-chip OSC/PLL non-bypassed	0000_H
1	1	0	User (JTAG) Mode[3]; on-chip OSC/PLL non-bypassed (normal)	0000_H

PLL Mode

The system clock is derived from the oscillator clock, multiplied by the N factor, and divided by the P and K factors. Both VCO bypass and PLL bypass must be inactive for this PLL mode. The PLL mode is used during normal system operation.

$$f_{SYS} = f_{OSC} \times \frac{N}{P \times K} \quad (3.3)$$

System Frequency Selection

For the XC886/888, the value of P is fixed to 1. In order to obtain the required fsys, the value of N and K can be selected by bits NDIV and KDIV respectively for different oscillator inputs. The output frequency must always be configured for 96 MHz. **Table 24** provides examples on how f_{sys} = 96 MHz can be obtained for the different oscillator sources.

Table 24 System frequency (f_{sys} = 96 MHz)

Oscillator	Fosc	N	P	K	Fsys
On-chip	9.6 MHz	20	1	2	96 MHz
External	8 MHz	24	1	2	96 MHz
	6 MHz	32	1	2	96 MHz
	4 MHz	48	1	2	96 MHz

3.8.2 Clock Management

The CGU generates all clock signals required within the microcontroller from a single clock, f_{sys}. During normal system operation, the typical frequencies of the different modules are as follow:

- CPU clock: CCLK, SCLK = 24 MHz
- Fast clock (used by MultiCAN): FCLK = 24 or 48 MHz
- Peripheral clock: PCLK = 24 MHz
- Flash Interface clock: CCLK2 = 48 MHz and CCLK = 24 MHz

In addition, different clock frequencies can be output to pin CLKOUT (P0.0 or P0.7). The clock output frequency, which is derived from the clock output divider (bit COREL), can further be divided by 2 using toggle latch (bit TLEN is set to 1). The resulting output frequency has a 50% duty cycle. **Figure 26** shows the clock distribution of the XC886/888.

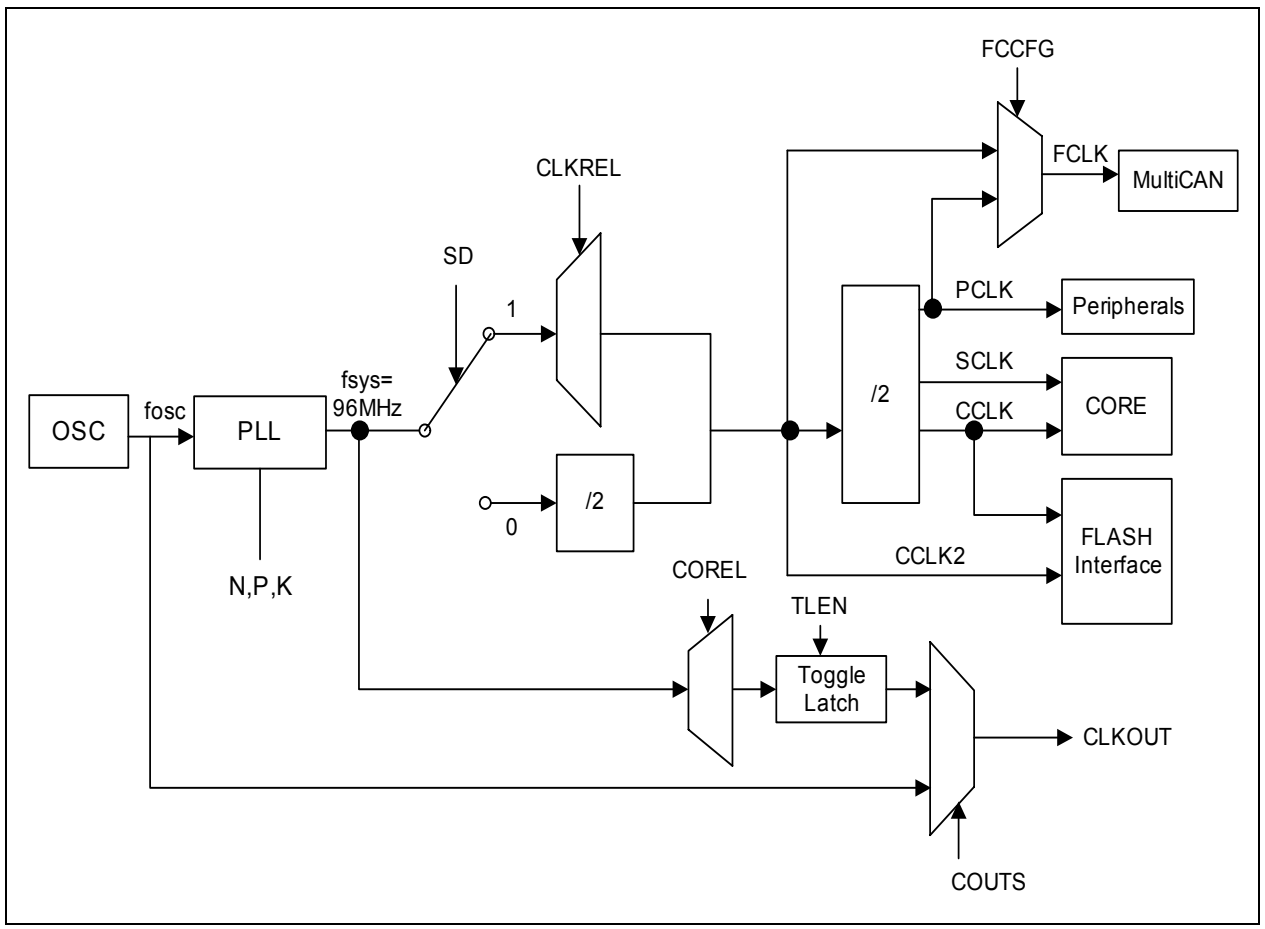

Figure 26 Clock Generation from f_{sys}

3.12 CORDIC Coprocessor

The CORDIC Coprocessor provides CPU with hardware support for the solving of circular (trigonometric), linear (multiply-add, divide-add) and hyperbolic functions.

Features

- Modes of operation
  - Supports all CORDIC operating modes for solving circular (trigonometric), linear (multiply-add, divide-add) and hyperbolic functions
  - Integrated look-up tables (LUTs) for all operating modes
- Circular vectoring mode: Extended support for values of initial X and Y data up to full range of $[-2^{15},(2^{15}-1)]$ for solving angle and magnitude
- Circular rotation mode: Extended support for values of initial Z data up to full range of $[-2^{15},(2^{15}-1)]$, representing angles in the range $[-\pi,((2^{15}-1)/2^{15})\pi]$ for solving trigonometry
- Implementation-dependent operational frequency of up to 80 MHz
- Gated clock input to support disabling of module
- 16-bit accessible data width
  - 24-bit kernel data width plus 2 overflow bits for X and Y each
  - 20-bit kernel data width plus 1 overflow bit for Z
  - With KEEP bit to retain the last value in the kernel register for a new calculation
- 16 iterations per calculation: Approximately 41 clock-cycles or less, from set of start (ST) bit to set of end-of-calculation flag, excluding time taken for write and read access of data bytes.
- Twos complement data processing
  - Only exception: X result data with user selectable option for unsigned result
- X and Y data generally accepted as integer or rational number; X and Y must be of the same data form
- Entries of LUTs are 20-bit signed integers
  - Entries of atan and atanh LUTs are integer representations (S19) of angles with the scaling such that $[-2^{15},(2^{15}-1)]$ represents the range $[-\pi,((2^{15}-1)/2^{15})\pi]$
  - Accessible Z result data for circular and hyperbolic functions is integer in data form of S15
- Emulated LUT for linear function
  - Data form is 1 integer bit and 15-bit fractional part (1.15)
  - Accessible Z result data for linear function is rational number with fixed data form of S4.11 (signed 4Q16)
- Truncation Error
  - The result of a CORDIC calculation may return an approximation due to truncation of LSBs
  - Good accuracy of the CORDIC calculated result data, especially in circular mode
- Interrupt
  - On completion of a calculation

fractional divider) for generating a wide range of baud rates based on its input clock f_{PCLK}, see **Figure 30**.

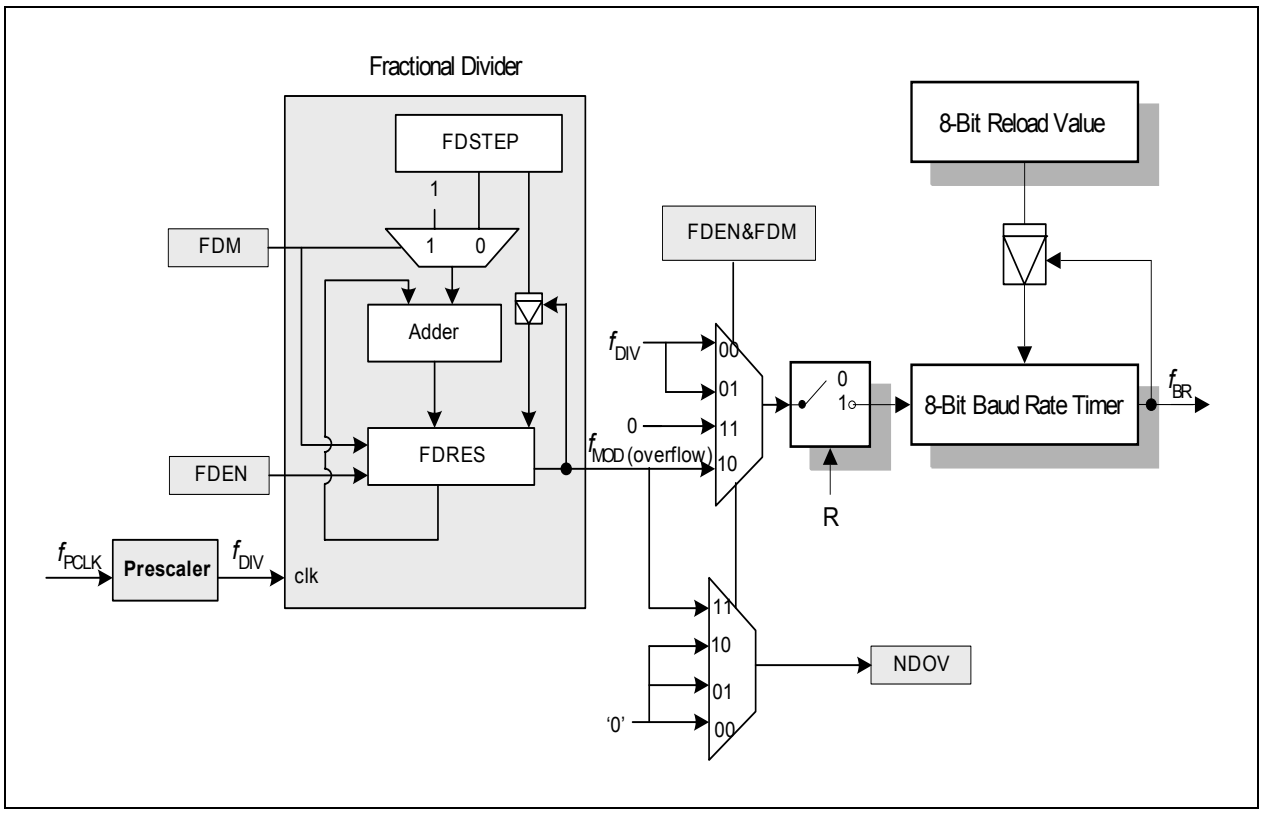

Figure 30 Baud-rate Generator Circuitry

The baud rate timer is a count-down timer and is clocked by either the output of the fractional divider (f_{MOD}) if the fractional divider is enabled (FDCON.FDEN = 1), or the output of the prescaler (f_{DIV}) if the fractional divider is disabled (FDEN = 0). For baud rate generation, the fractional divider must be configured to fractional divider mode (FDCON.FDM = 0). This allows the baud rate control run bit BCON.R to be used to start or stop the baud rate timer. At each timer underflow, the timer is reloaded with the 8-bit reload value in register BG and one clock pulse is generated for the serial channel.

Enabling the fractional divider in normal divider mode (FDEN = 1 and FDM = 1) stops the baud rate timer and nullifies the effect of bit BCON.R. See **Section 3.14**.

The baud rate (f_{BR}) value is dependent on the following parameters:

- Input clock f_{PCLK}
- Prescaling factor (2^{BRPRE}) defined by bit field BRPRE in register BCON
- Fractional divider (STEP/256) defined by register FDSTEP
  (to be considered only if fractional divider is enabled and operating in fractional divider mode)
- 8-bit reload value (BR_VALUE) for the baud rate timer defined by register BG

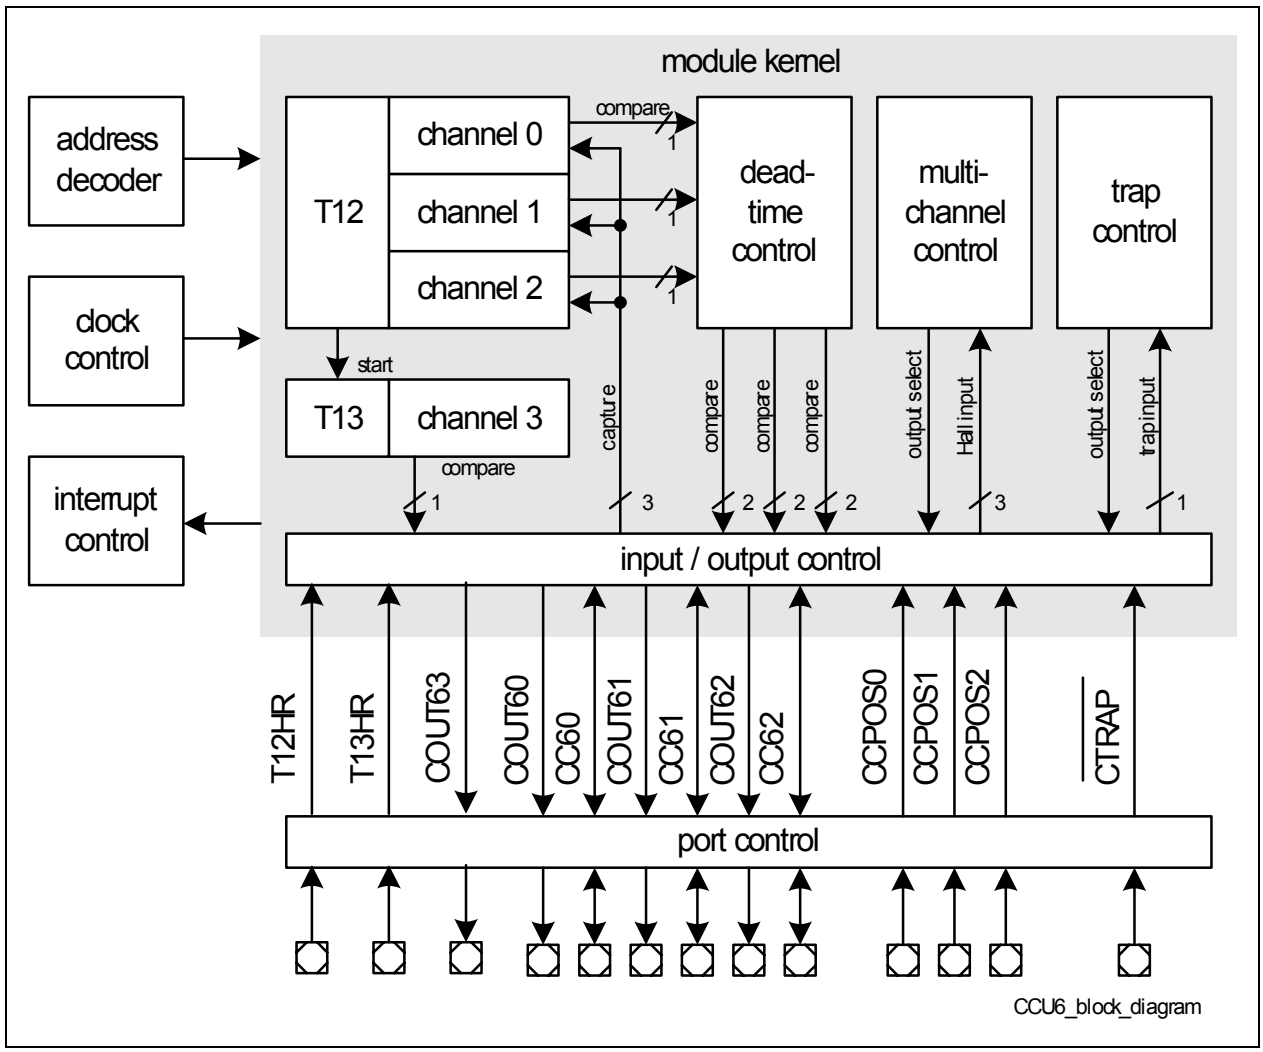

Figure 33 CCU6 Block Diagram

- CAN functionality according to CAN specification V2.0 B active.
- Dedicated control registers are provided for each CAN node.
- A data transfer rate up to 1 MBaud is supported.
- Flexible and powerful message transfer control and error handling capabilities are implemented.
- Advanced CAN bus bit timing analysis and baud rate detection can be performed for each CAN node via the frame counter.
- Full-CAN functionality: A set of 32 message objects can be individually
  - allocated (assigned) to any CAN node
  - configured as transmit or receive object
  - setup to handle frames with 11-bit or 29-bit identifier
  - counted or assigned a timestamp via a frame counter
  - configured to remote monitoring mode
- Advanced Acceptance Filtering:
  - Each message object provides an individual acceptance mask to filter incoming frames.
  - A message object can be configured to accept only standard or only extended frames or to accept both standard and extended frames.
  - Message objects can be grouped into 4 priority classes.
  - The selection of the message to be transmitted first can be performed on the basis of frame identifier, IDE bit and RTR bit according to CAN arbitration rules.
- Advanced Message Object Functionality:
  - Message Objects can be combined to build FIFO message buffers of arbitrary size, which is only limited by the total number of message objects.
  - Message objects can be linked to form a gateway to automatically transfer frames between 2 different CAN buses. A single gateway can link any two CAN nodes. An arbitrary number of gateways may be defined.
- Advanced Data Management:
  - The Message objects are organized in double chained lists.
  - List reorganizations may be performed any time, even during full operation of the CAN nodes.
  - A powerful, command driven list controller manages the organization of the list structure and ensures consistency of the list.
  - Message FIFOs are based on the list structure and can easily be scaled in size during CAN operation.
  - Static Allocation Commands offer compatibility with TwinCAN applications, which are not list based.
- Advanced Interrupt Handling:
  - Up to 8 interrupt output lines are available. Most interrupt requests can be individually routed to one of the 8 interrupt output lines.
  - Message postprocessing notifications can be flexibly aggregated into a dedicated register field of 64 notification bits.

4.2 DC Parameters

The electrical characteristics of the DC Parameters are detailed in this section.

4.2.1 Input/Output Characteristics

Table 38 provides the characteristics of the input/output pins of the XC886/888.

Table 38 Input/Output Characteristics (Operating Conditions apply)

Parameter	Symbol		Limit Values		Unit	Test Conditions
			min.	max.		
V_{DDP} = 5 V Range						
Output low voltage	V_{OL}	CC	–	1.0	V	I_{OL} = 15 mA
			–	1.0	V	I_{OL} = 5 mA, current into all pins > 60 mA
			–	0.4	V	I_{OL} = 5 mA, current into all pins ≤ 60 mA
Output high voltage	V_{OH}	CC	V_{DDP} - 1.0	–	V	I_{OH} = -15 mA
			V_{DDP} - 1.0	–	V	I_{OH} = -5 mA, current from all pins > 60 mA
			V_{DDP} - 0.4	–	V	I_{OH} = -5 mA, current from all pins ≤ 60 mA
Input low voltage on port pins (all except P0.0 & P0.1)	V_{ILP}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on P0.0 & P0.1	V_{ILP0}	SR	-0.2	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on $\overline{\text{RESET}}$ pin	V_{ILR}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on TMS pin	V_{ILT}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input high voltage on port pins (all except P0.0 & P0.1)	V_{IHP}	SR	0.7 × V_{DDP}	–	V	CMOS Mode
Input high voltage on P0.0 & P0.1	V_{IHP0}	SR	0.7 × V_{DDP}	V_{DDP}	V	CMOS Mode

Table 38 Input/Output Characteristics (Operating Conditions apply) (cont'd)

Parameter	Symbol		Limit Values		Unit	Test Conditions
			min.	max.		
Maximum current out of V_{SS}	I_{MVSS}	SR	–	120	mA	[3]
V_{DDP} = 3.3 V Range						
Output low voltage	V_{OL}	CC	–	1.0	V	I_{OL} = 8 mA
			–	0.4	V	I_{OL} = 2.5 mA
Output high voltage	V_{OH}	CC	V_{DDP} - 1.0	–	V	I_{OH} = -8 mA
			V_{DDP} - 0.4	–	V	I_{OH} = -2.5 mA
Input low voltage on port pins (all except P0.0 & P0.1)	V_{ILP}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on P0.0 & P0.1	V_{ILP0}	SR	-0.2	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on RESET pin	V_{ILR}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input low voltage on TMS pin	V_{ILT}	SR	–	0.3 × V_{DDP}	V	CMOS Mode
Input high voltage on port pins (all except P0.0 & P0.1)	V_{IHP}	SR	0.7 × V_{DDP}	–	V	CMOS Mode
Input high voltage on P0.0 & P0.1	V_{IHP0}	SR	0.7 × V_{DDP}	V_{DDP}	V	CMOS Mode
Input high voltage on RESET pin	V_{IHR}	SR	0.7 × V_{DDP}	–	V	CMOS Mode
Input high voltage on TMS pin	V_{IHT}	SR	0.75 × V_{DDP}	–	V	CMOS Mode
Input Hysteresis	HYS	CC	0.03 × V_{DDP}	–	V	CMOS Mode[1]
Input Hysteresis on XTAL1	$HYSX$	CC	0.07 × V_{DDC}	–	V	[1]
Input low voltage at XTAL1	V_{ILX}	SR	V_{SS} - 0.5	0.3 × V_{DDC}	V
