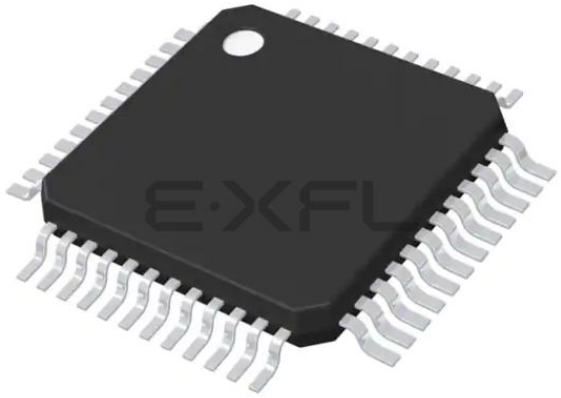
Infineon Technologies - XC886LM6FFI5VACFXUMA1 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Discontinued at Digi-Key
Core Processor	XC800
Core Size	8-Bit
Speed	24MHz
Connectivity	LINbus, SSI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	34
Program Memory Size	24KB (24K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.75K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-LQFP
Supplier Device Package	PG-TQFP-48
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xc886lm6ffi5vacfxuma1

Table 2 Device Profile (cont'd)

Sales Type	Device Type	Program Memory (Kbytes)	Power Supply (V)	Temp-erature (°C)	Quality Profile
SAK-XC886*/888*-8FFA 3V3	Flash	32	3.3	-40 to 125	Automotive
SAK-XC886*/888*-6FFA 3V3	Flash	24	3.3	-40 to 125	Automotive
SAF-XC886*/888*-8FFA 3V3	Flash	32	3.3	-40 to 85	Automotive
SAF-XC886*/888*-6FFA 3V3	Flash	24	3.3	-40 to 85	Automotive
SAF-XC886*/888*-8FFI 3V3	Flash	32	3.3	-40 to 85	Industrial
SAF-XC886*/888*-6FFI 3V3	Flash	24	3.3	-40 to 85	Industrial

*Note: The asterisk (*) above denotes the device configuration letters from **Table 1**. Corresponding ROM derivatives will be available on request.*

Note: For variants with LIN BSL support, only LIN BSL is available regardless of the availability of the CAN module.

As this document refers to all the derivatives, some description may not apply to a specific product. For simplicity, all versions are referred to by the term XC886/888 throughout this document.

Ordering Information

The ordering code for Infineon Technologies microcontrollers provides an exact reference to the required product. This ordering code identifies:

- The derivative itself, i.e. its function set, the temperature range, and the supply voltage
- The package and the type of delivery

For the available ordering codes for the XC886/888, please refer to your responsible sales representative or your local distributor.

Note: The ordering codes for the Mask-ROM versions are defined for each product after verification of the respective ROM code.

2 General Device Information

Chapter 2 contains the block diagram, pin configurations, definitions and functions of the XC886/888.

2.1 Block Diagram

The block diagram of the XC886/888 is shown in **Figure 2**.

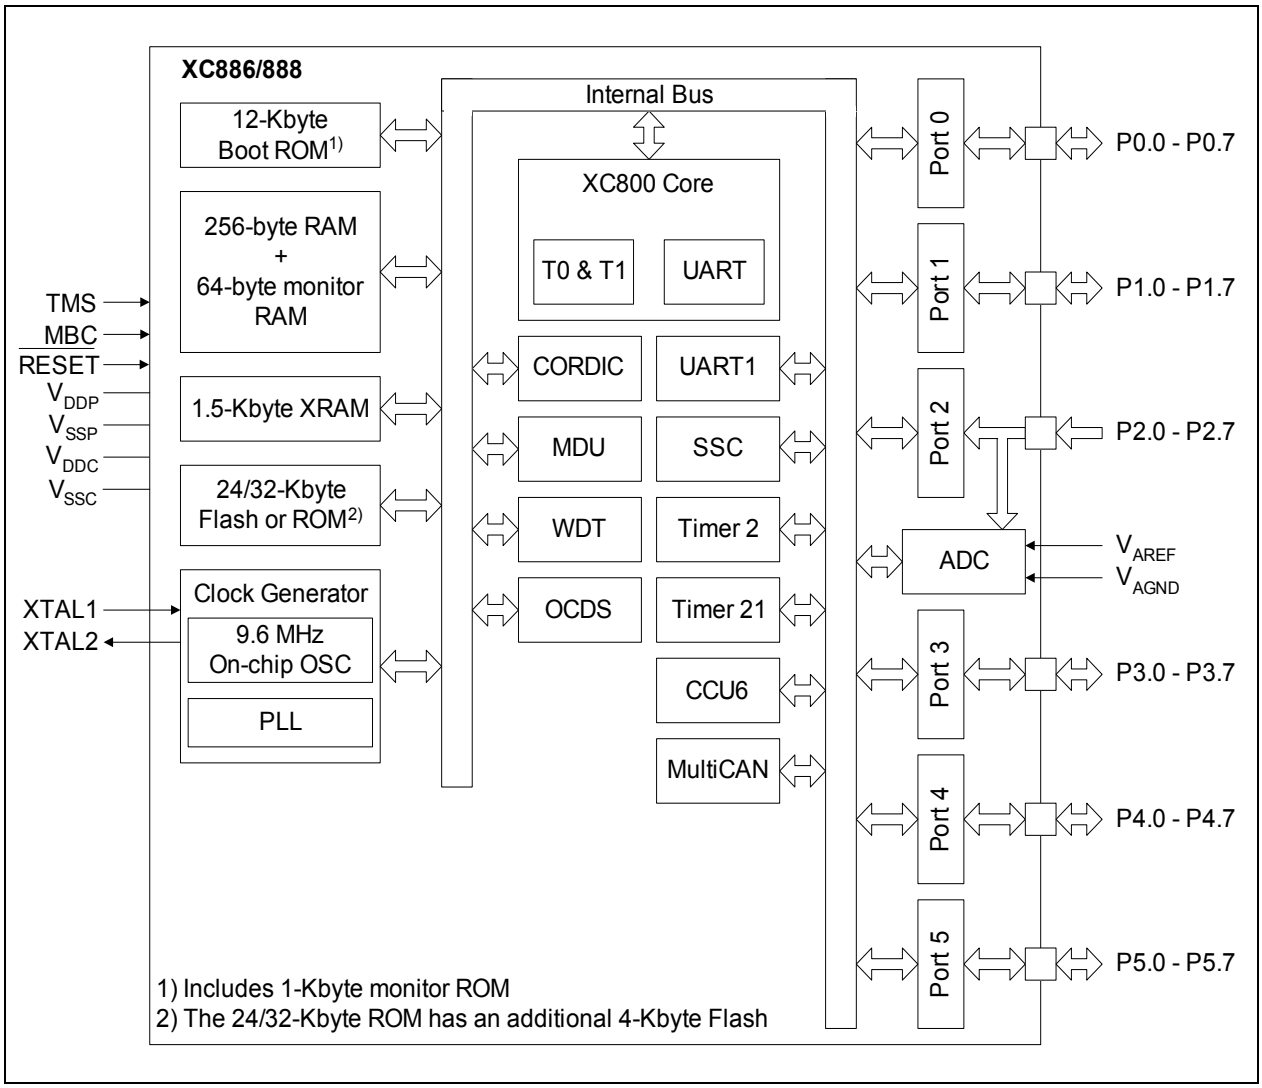


Figure 2 XC886/888 Block Diagram

2.3 Pin Configuration

The pin configuration of the XC886, which is based on the PG-TQFP-48 package, is shown in **Figure 4**, while that of the XC888, which is based on the PG-TQFP-64 package, is shown in **Figure 5**.

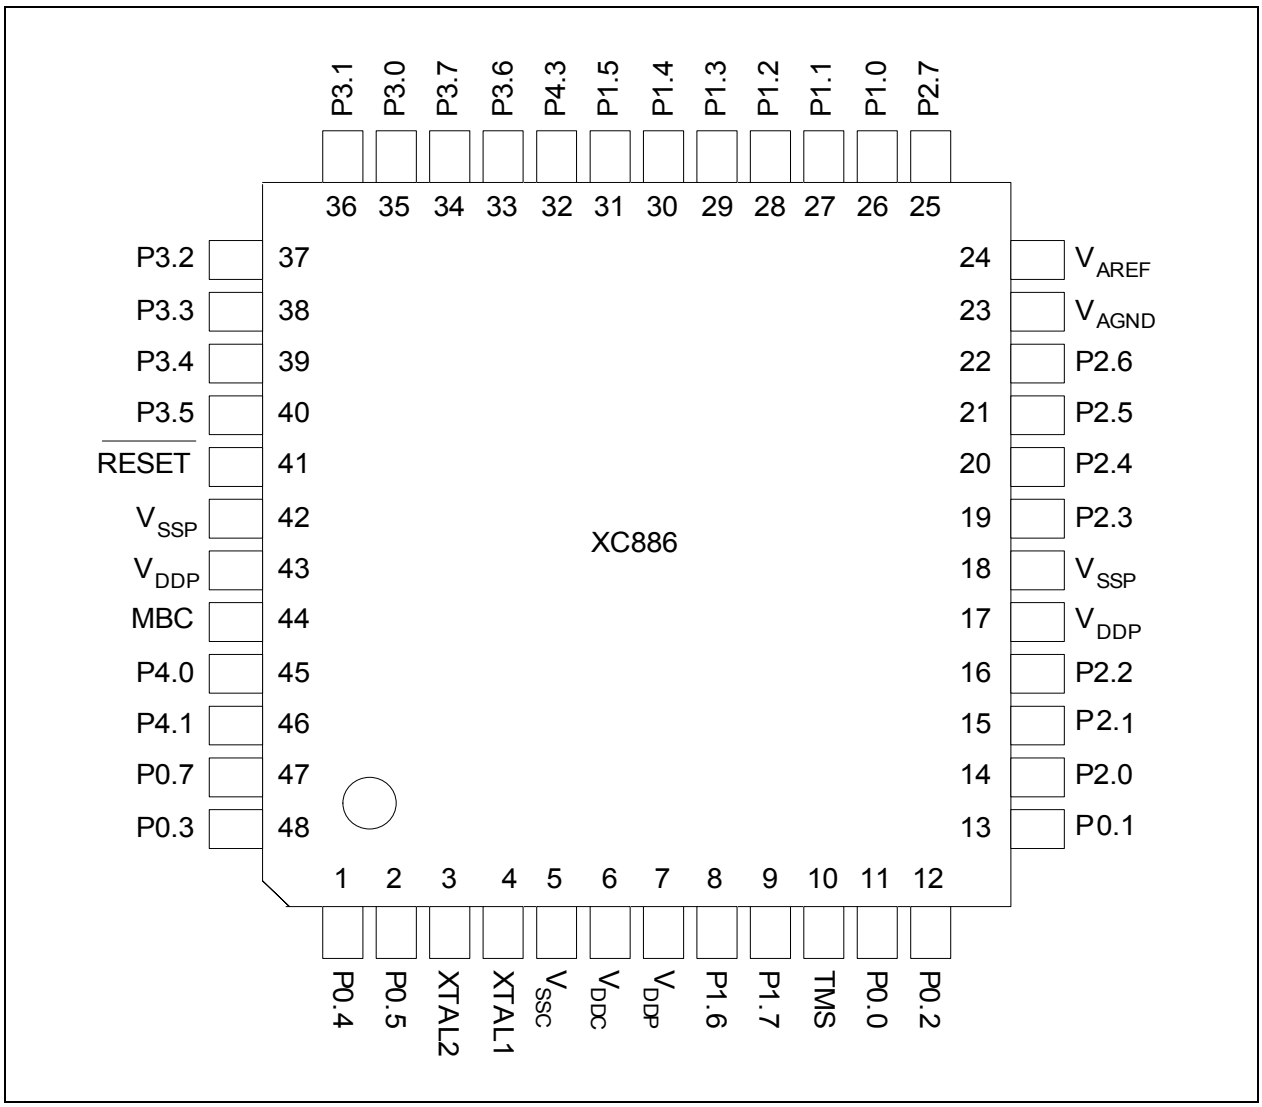

Figure 4 XC886 Pin Configuration, PG-TQFP-48 Package (top view)

Table 3 Pin Definitions and Functions (cont'd)

Symbol	Pin Number (TQFP-48/64)	Type	Reset State	Function	
P1		I/O		**Port 1** Port 1 is an 8-bit bidirectional general purpose I/O port. It can be used as alternate functions for the JTAG, CCU6, UART, Timer 0, Timer 1, Timer 2, Timer 21, MultiCAN and SSC.

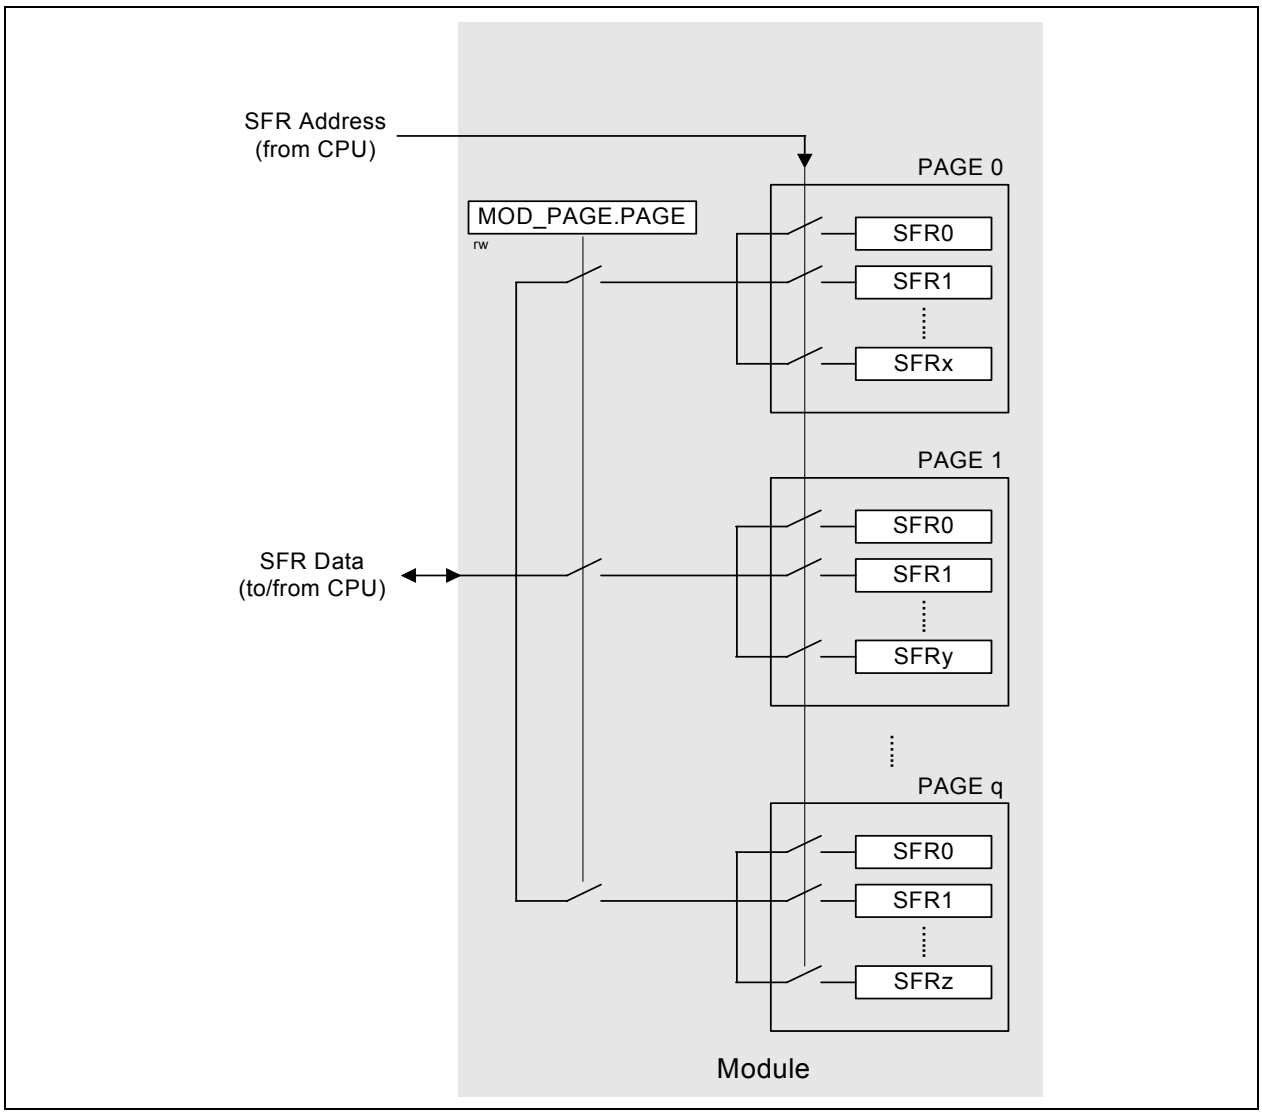

Figure 9 Address Extension by Paging

In order to access a register located in a page different from the actual one, the current page must be exited. This is done by reprogramming the bit field PAGE in the page register. Only then can the desired access be performed.

If an interrupt routine is initiated between the page register access and the module register access, and the interrupt needs to access a register located in another page, the current page setting can be saved, the new one programmed and the old page setting restored. This is possible with the storage fields STx (x = 0 - 3) for the save and restore action of the current page setting. By indicating which storage bit field should be used in parallel with the new page value, a single write operation can:

- Save the contents of PAGE in STx before overwriting with the new value
  (this is done in the beginning of the interrupt routine to save the current page setting and program the new page number); or

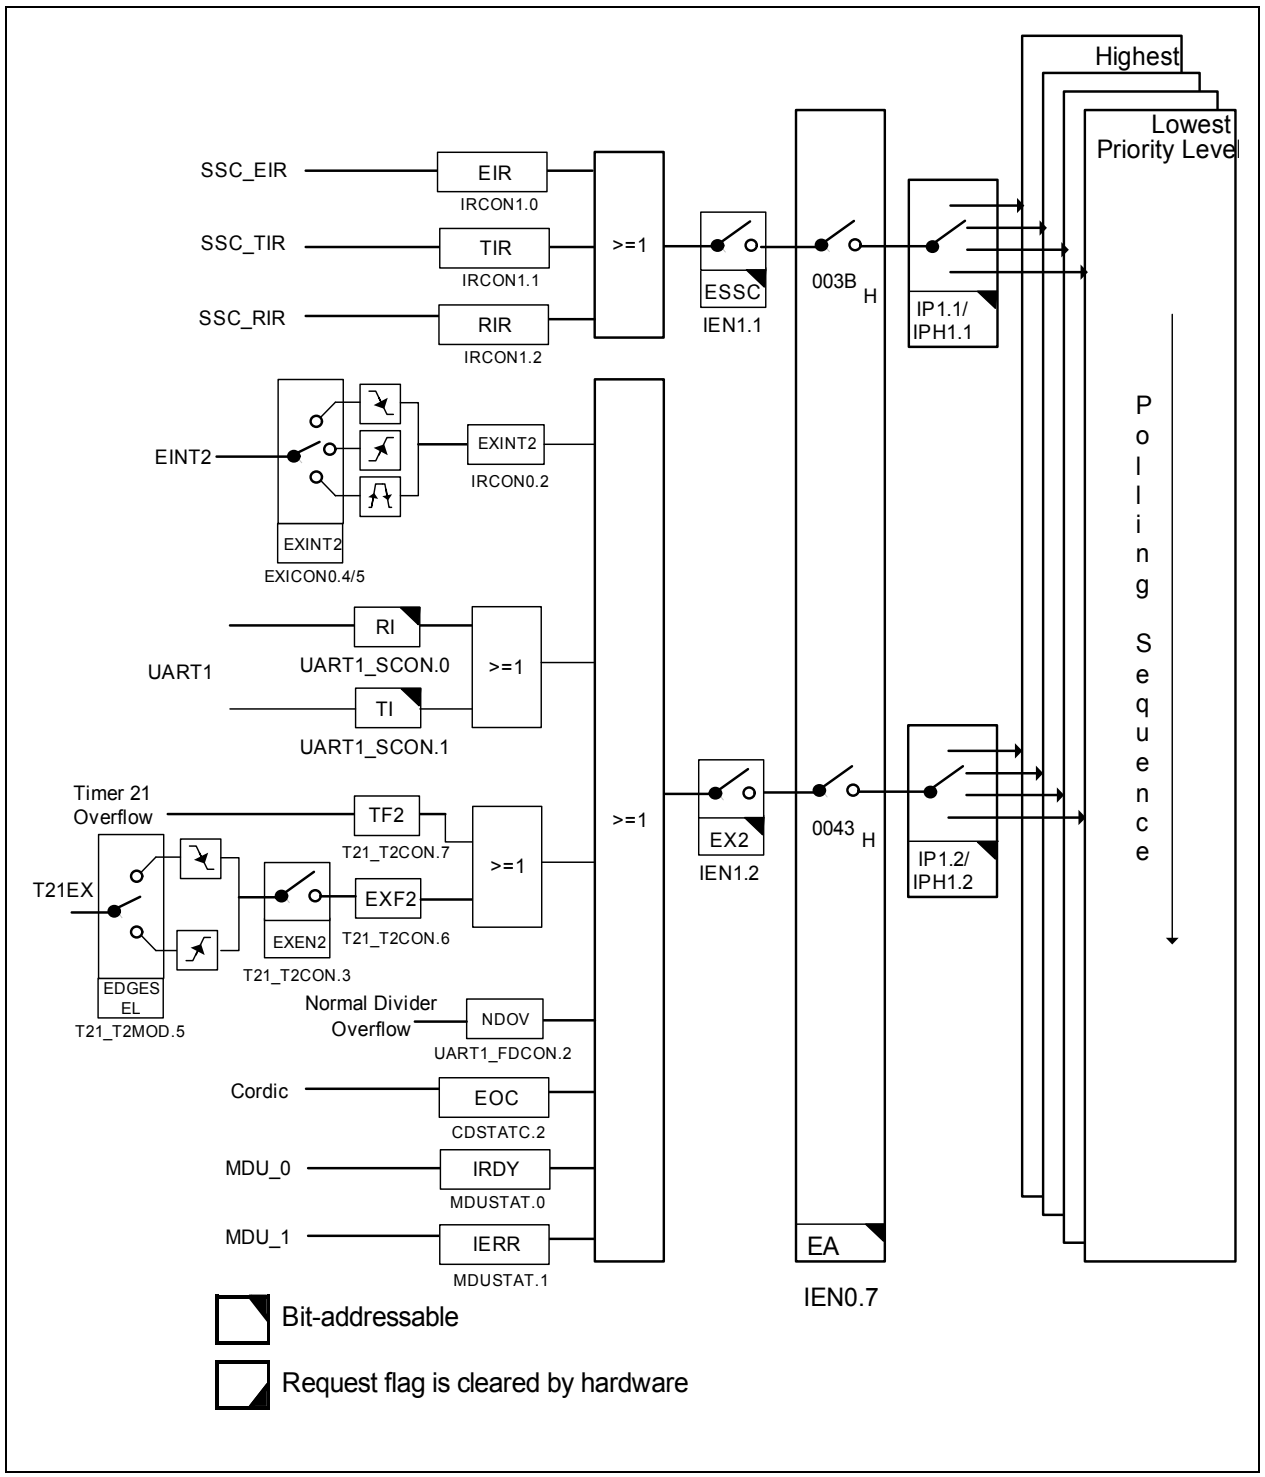

Figure 16 Interrupt Request Sources (Part 3)

3.8.2 Clock Management

The CGU generates all clock signals required within the microcontroller from a single clock, f_{sys}. During normal system operation, the typical frequencies of the different modules are as follow:

- CPU clock: CCLK, SCLK = 24 MHz
- Fast clock (used by MultiCAN): FCLK = 24 or 48 MHz
- Peripheral clock: PCLK = 24 MHz
- Flash Interface clock: CCLK2 = 48 MHz and CCLK = 24 MHz

In addition, different clock frequencies can be output to pin CLKOUT (P0.0 or P0.7). The clock output frequency, which is derived from the clock output divider (bit COREL), can further be divided by 2 using toggle latch (bit TLEN is set to 1). The resulting output frequency has a 50% duty cycle. **Figure 26** shows the clock distribution of the XC886/888.

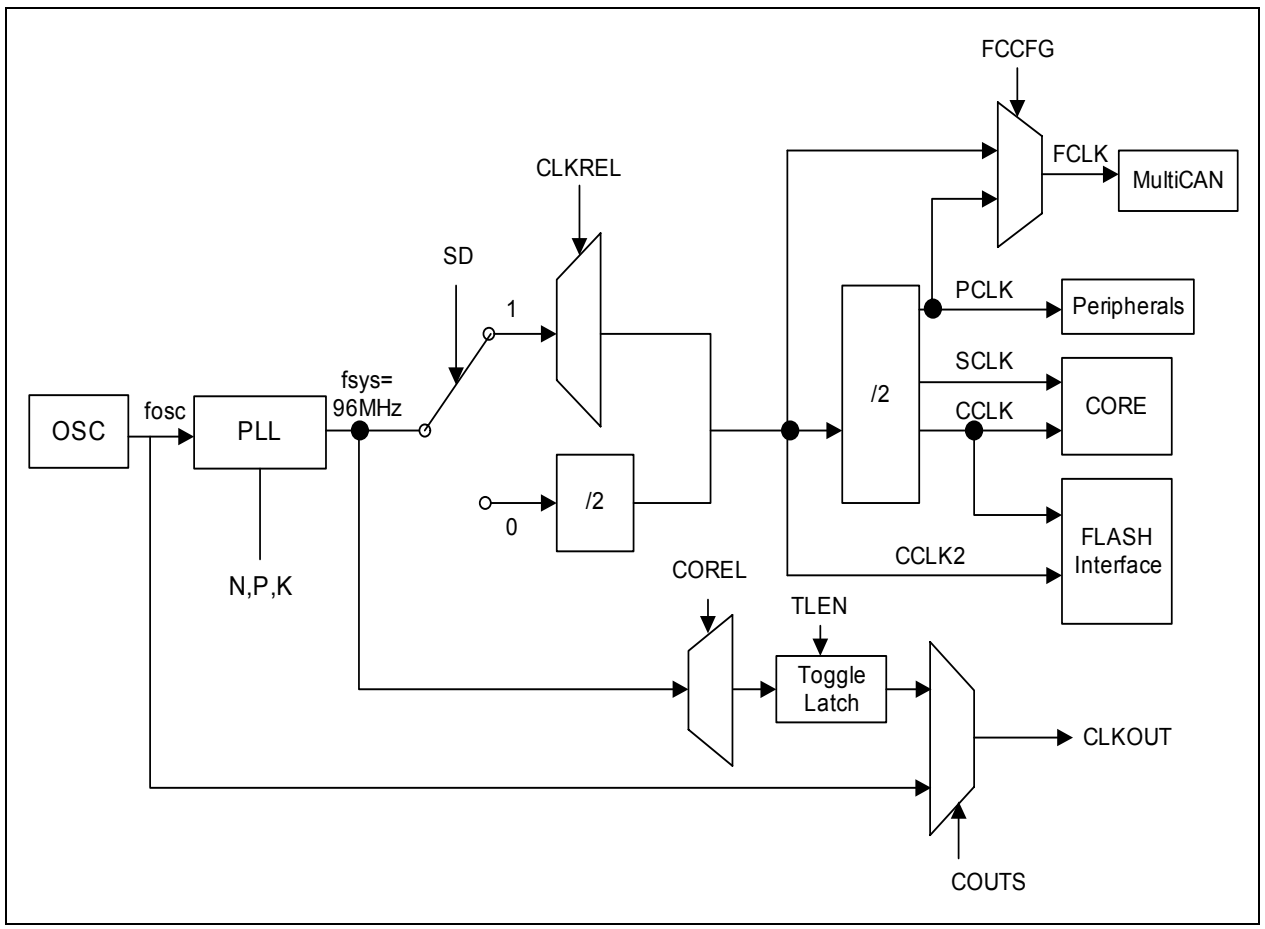

Figure 26 Clock Generation from f_{sys}

3.18 Timer 2 and Timer 21

Timer 2 and Timer 21 are 16-bit general purpose timers (THL2) that are fully compatible and have two modes of operation, a 16-bit auto-reload mode and a 16-bit one channel capture mode, see **Table 33**. As a timer, the timers count with an input clock of PCLK/12 (if prescaler is disabled). As a counter, they count 1-to-0 transitions on pin T2. In the counter mode, the maximum resolution for the count is PCLK/24 (if prescaler is disabled).

Table 33 Timer 2 Modes

Mode	Description
Auto-reload	**Up/Down Count Disabled** • Count up only • Start counting from 16-bit reload value, overflow at $FFFF_H$ • Reload event configurable for trigger by overflow condition only, or by negative/positive edge at input pin T2EX as well • Programmble reload value in register RC2 • Interrupt is generated with reload event
	Up/Down Count Enabled • Count up or down, direction determined by level at input pin T2EX • No interrupt is generated • Count up – Start counting from 16-bit reload value, overflow at $FFFF_H$ – Reload event triggered by overflow condition – Programmble reload value in register RC2 • Count down – Start counting from $FFFF_H$, underflow at value defined in register RC2 – Reload event triggered by underflow condition – Reload value fixed at $FFFF_H$
Channel capture	• Count up only • Start counting from 0000_H, overflow at $FFFF_H$ • Reload event triggered by overflow condition • Reload value fixed at 0000_H • Capture event triggered by falling/rising edge at pin T2EX • Captured timer value stored in register RC2 • Interrupt is generated with reload or capture event

4.1.3 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation of the XC886/888. All parameters mentioned in the following table refer to these operating conditions, unless otherwise noted.

Table 37 Operating Condition Parameters

Parameter	Symbol	Limit Values		Unit	Notes/ Conditions
		min.	max.		
Digital power supply voltage	V_{DDP}	4.5	5.5	V	5V Device
Digital power supply voltage	V_{DDP}	3.0	3.6	V	3.3V Device
Digital ground voltage	V_{SS}	0		V	
Digital core supply voltage	V_{DDC}	2.3	2.7	V	
System Clock Frequency[1)]	f_{SYS}	88.8	103.2	MHz	
Ambient temperature	T_A	-40	85	°C	SAF-XC886/888...
		-40	125	°C	SAK-XC886/888...

1) f_{SYS} is the PLL output clock. During normal operating mode, CPU clock is f_{SYS} / 4. Please refer to **Figure 26** for detailed description.

4.2.2 Supply Threshold Characteristics

Table 39 provides the characteristics of the supply threshold in the XC886/888.

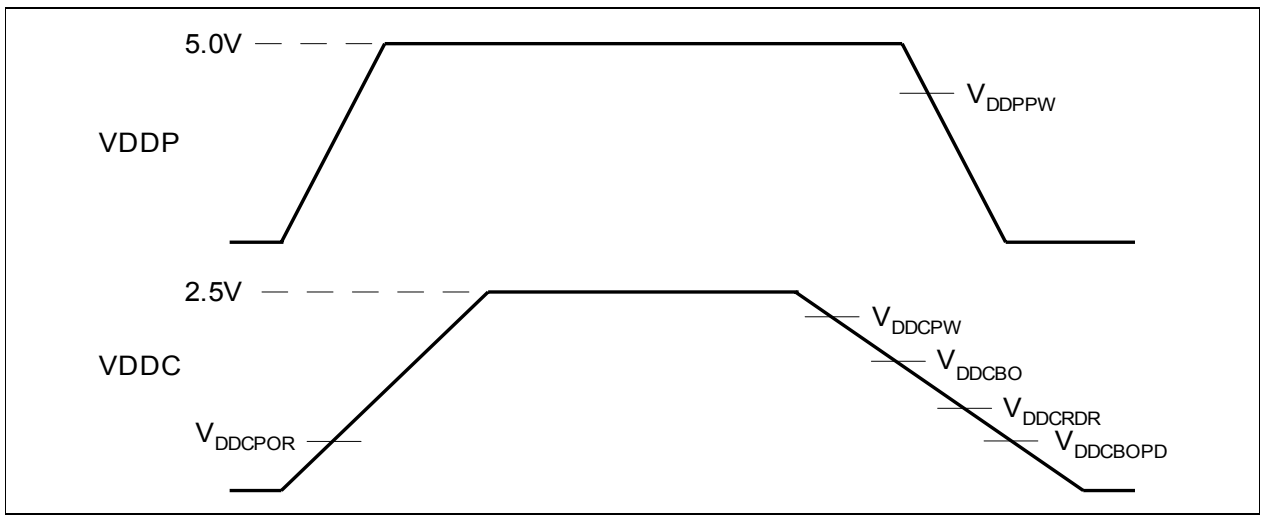

Figure 38 Supply Threshold Parameters

Table 39 Supply Threshold Parameters (Operating Conditions apply)

Parameters	Symbol		Limit Values			Unit
			min.	typ.	max.	
V_{DDC} prewarning voltage[1)]	V_{DDCPW}	CC	2.2	2.3	2.4	V
V_{DDC} brownout voltage in active mode[1)]	V_{DDCBO}	CC	2.0	2.1	2.2	V
RAM data retention voltage	V_{DDCRDR}	CC	0.9	1.0	1.1	V
V_{DDC} brownout voltage in power-down mode[2)]	$V_{DDCBOPD}$	CC	1.3	1.5	1.7	V
V_{DDP} prewarning voltage[3)]	V_{DDPPW}	CC	3.4	4.0	4.6	V
Power-on reset voltage[2)4)]	V_{DDCPOR}	CC	1.3	1.5	1.7	V

1) Detection is disabled in power-down mode.

2) Detection is enabled in both active and power-down mode.

3) Detection is enabled for external power supply of 5.0V.
Detection must be disabled for external power supply of 3.3V.

4) The reset of EVR is extended by 300 µs typically after the VDDC reaches the power-on reset voltage.

Table 40 ADC Characteristics (Operating Conditions apply; V_{DDP} = 5V Range)

Parameter	Symbol		Limit Values			Unit	Test Conditions/ Remarks
			min.	typ .	max.		
Overload current coupling factor for digital I/O pins	K_{OVD}	CC	–	–	5.0 x 10^{-3}	–	$I_{OV} > 0$ 1)3)
			–	–	1.0 x 10^{-2}	–	$I_{OV} < 0$ 1)3)
Switched capacitance at the reference voltage input	C_{AREFSW}	CC	–	10	20	pF	1)4)
Switched capacitance at the analog voltage inputs	C_{AINSW}	CC	–	5	7	pF	1)5)
Input resistance of the reference input	R_{AREF}	CC	–	1	2	kΩ	1)
Input resistance of the selected analog channel	R_{AIN}	CC	–	1	1.5	kΩ	1)

1) Not subjected to production test, verified by design/characterization

2) TUE is tested at V_{AREF} = 5.0 V, V_{AGND} = 0 V, V_{DDP} = 5.0 V.

3) An overload current (I_{OV}) through a pin injects a certain error current (I_{INJ}) into the adjacent pins. This error current adds to the respective pin's leakage current (I_{OZ}). The amount of error current depends on the overload current and is defined by the overload coupling factor K_{OV}. The polarity of the injected error current is inverse compared to the polarity of the overload current that produces it. The total current through a pin is $|I_{TOT}| = |I_{OZ1}| + (|I_{OV}| \times K_{OV})$. The additional error current may distort the input voltage on analog inputs.

4) This represents an equivalent switched capacitance. This capacitance is not switched to the reference voltage at once. Instead of this, smaller capacitances are successively switched to the reference voltage.

5) The sampling capacity of the conversion C-Network is pre-charged to $V_{AREF}/2$ before connecting the input to the C-Network. Because of the parasitic elements, the voltage measured at ANx is lower than $V_{AREF}/2$.

4.2.4 Power Supply Current

Table 41, **Table 42**, **Table 43** and **Table 44** provide the characteristics of the power supply current in the XC886/888.

Table 41 Power Supply Current Parameters (Operating Conditions apply; V_{DDP} = 5V range)

Parameter	Symbol	Limit Values		Unit	Test Condition
		typ.[1]	max.[2]		
V_{DDP} = 5V Range					
Active Mode	I_{DDP}	27.2	32.8	mA	Flash Device[3]
		24.3	29.8	mA	ROM Device[3]
Idle Mode	I_{DDP}	21.1	25.3	mA	Flash Device[4]
		18.2	21.6	mA	ROM Device[4]
Active Mode with slow-down enabled	I_{DDP}	14.1	17.0	mA	Flash Device[5]
		11.9	14.3	mA	ROM Device[5]
Idle Mode with slow-down enabled	I_{DDP}	11.7	15.0	mA	Flash Device[6]
		9.7	11.9	mA	ROM Device[6]

1) The typical I_{DDP} values are periodically measured at T_A = + 25 °C and V_{DDP} = 5.0 V.

2) The maximum I_{DDP} values are measured under worst case conditions (T_A = + 125 °C and V_{DDP} = 5.5 V).

3) I_{DDP} (active mode) is measured with: CPU clock and input clock to all peripherals running at 24 MHz(set by on-chip oscillator of 9.6 MHz and NDIV in PLL_CON to 1001_B), $\overline{\text{RESET}}$ = V_{DDP}, no load on ports.

4) I_{DDP} (idle mode) is measured with: CPU clock disabled, watchdog timer disabled, input clock to all peripherals enabled and running at 24 MHz, $\overline{\text{RESET}}$ = V_{DDP}, no load on ports.

5) I_{DDP} (active mode with slow-down mode) is measured with: CPU clock and input clock to all peripherals running at 8 MHz by setting CLKREL in CMCON to 0110_B, $\overline{\text{RESET}}$ = V_{DDP}, no load on ports.

6) I_{DDP} (idle mode with slow-down mode) is measured with: CPU clock disabled, watchdog timer disabled, input clock to all peripherals enabled and running at 8 MHz by setting CLKREL in CMCON to 0110_B, $\overline{\text{RESET}}$ = V_{DDP}, no load on ports.

4.3.5 External Clock Drive XTAL1

Table 48 shows the parameters that define the external clock supply for XC886/888. These timing parameters are based on the direct XTAL1 drive of clock input signals. They are not applicable if an external crystal or ceramic resonator is considered.

Table 48 External Clock Drive Characteristics (Operating Conditions apply)

Parameter	Symbol		Limit Values		Unit	Test Conditions
			Min.	Max.		
Oscillator period	t_{osc}	SR	83.3	250	ns	1)2)
High time	t_1	SR	25	-	ns	2)3)
Low time	t_2	SR	25	-	ns	2)3)
Rise time	t_3	SR	-	20	ns	2)3)
Fall time	t_4	SR	-	20	ns	2)3)

1) The clock input signals with 45-55% duty cycle are used.

2) Not all parameters are 100% tested, but are verified by design/characterization and test correlation.

3) The clock input signal must reach the defined levels V_{ILX} and V_{IHX}.

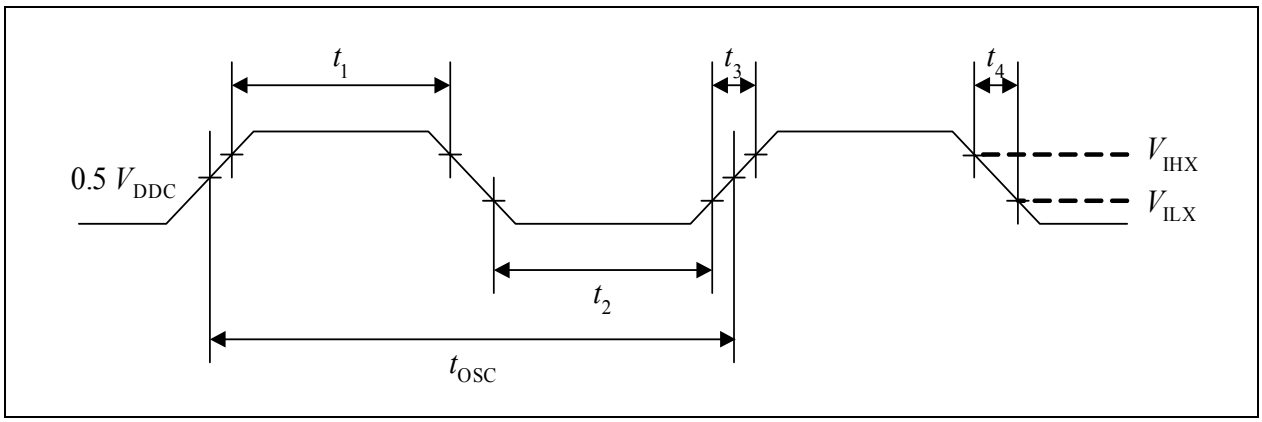

Figure 45 External Clock Drive XTAL1

Table 50 JTAG Timing (Operating Conditions apply; CL = 50 pF) (cont'd)

Parameter	Symbol		Limits		Unit	Test Conditions
			min	max		
TDO high impedance to valid output from TCK	t_4	CC	-	27	ns	5V Device[1)]
			-	36	ns	3.3V Device[1)]
TDO valid output to high impedance from TCK	t_5	CC	-	22	ns	5V Device[1)]
			-	28	ns	3.3V Device[1)]

1) Not all parameters are 100% tested, but are verified by design/characterization and test correlation.

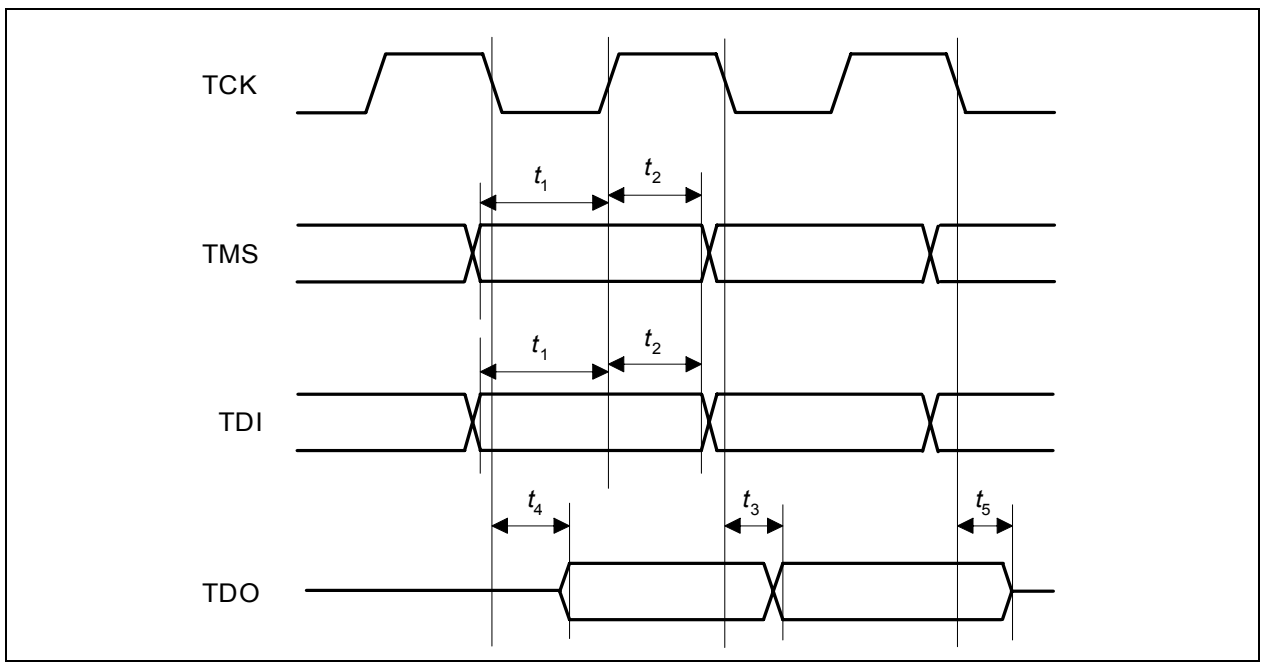

Figure 47 JTAG Timing

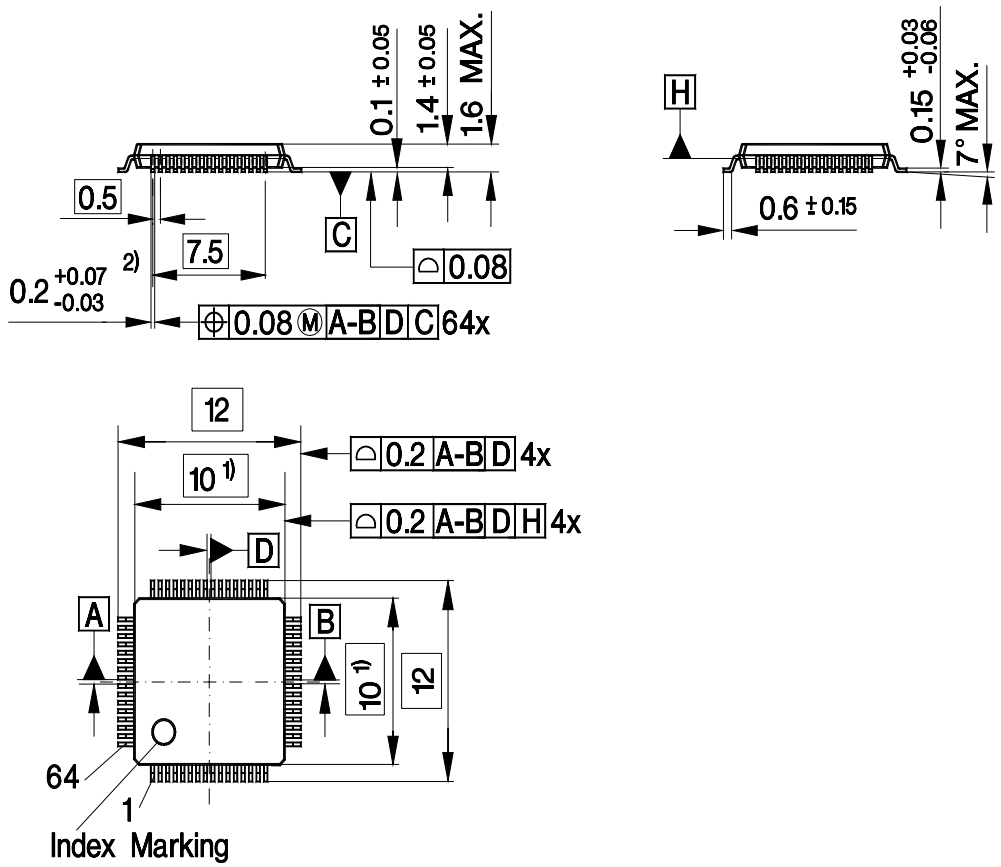
Figure 49 shows the package outlines of the XC888.



1) Does not include plastic or metal protrusion of 0.25 max. per side
2) Does not include dambar protrusion of 0.08 max. per side
