## Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

## Applications of Embedded - CPLDs

### Details

|                                 |                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status                  | Obsolete                                                                                                                                                                          |

## ispLSI 5000VE Description (Continued)

The 32 registered macrocells in the GLB are driven by the 32 outputs from the PTSA or the PTSA bypass. Each macrocell contains a programmable XOR gate, a programmable register/latch and the necessary clocks and control logic to allow combinatorial or registered operation. The macrocells each have two outputs, combinatorial and registered. This dual output capability from the macrocell allows efficient use of the hardware resources. One output can be a registered function for example, while the other output can be an unrelated combinatorial function. A direct register input from the I/O pad facilitates efficient use of this feature to construct high-speed input registers.

Macrocell registers can be clocked from one of several global or product term clocks available on the device. A global and product term clock enable is also available to each register, eliminating the need to gate the clock to the macrocell registers. Reset for the macrocell register is provided from the global signal, its polarity is user-selectable. The macrocell register can be programmed to operate as a D-type register or a D-type latch.

The 32 outputs from the GLB can drive both the Global Routing Pool and the device I/O cells. The Global Routing Pool contains one input from each macrocell output and one input from each I/O pin.

The input buffer threshold has programmable TTL/3.3V/2.5V compatible levels. The output driver can source 4mA and sink 8mA in 3.3V mode. The output drivers have a separate VCCIO reference input which is independent of the main VCC supply for the device. This feature allows individual output drivers to drive either 3.3V (from the device VCC) or 2.5V (from the VCCIO pin) output levels while the device logic and the output current drive are powered from device supply (VCC). The output drivers also provide individually programmable edge rates and open drain capability. A programmable pullup resistor is provided to tie off unused inputs. Additionally, a programmable bus-hold latch is available to hold tristate outputs in their last valid state until the bus is driven again by some device.

**Table 1. ispLSI 5000VE Family**

| Device        | GLBs | Macrocells | Package Type |          |           |         |           |         |
|---------------|------|------------|--------------|----------|-----------|---------|-----------|---------|
|               |      |            | 100 TQFP     | 128 TQFP | 256 fpBGA | 272 BGA | 388 fpBGA | 388 BGA |
| ispLSI 5128VE | 4    | 128        | —            | 96 I/O   | —         | —       | —         | —       |
| ispLSI 5256VE | 8    | 256        | 72 I/O       | 96 I/O   | 144 I/O   | 144 I/O | —         | —       |
| ispLSI 5384VE | 12   | 384        | —            | —        | 192 I/O   | 192 I/O | —         | —       |
| ispLSI 5512VE | 16   | 512        | —            | —        | 192 I/O   | 192 I/O | 256 I/O   | 256 I/O |

The ispLSI 5000VE Family features 3.3V, non-volatile in-system programmability for both the logic and the interconnect structures, providing the means to develop truly reconfigurable systems. Programming is achieved through the industry standard IEEE 1149.1-compliant Boundary Scan interface. Boundary Scan test is also supported through the same interface.

An enhanced, multiple cell security scheme is provided that prevents reading of the JEDEC programming file when secured. After the device has been secured using this mechanism, the only way to clear the security is to execute a bulk-erase instruction.

## ispLSI 5000VE Family Members

The ispLSI 5000VE Family ranges from 128 macrocells to 512 macrocells and operates from a 3.3V power supply. All family members will be available with multiple package options. The ispLSI 5000VE Family device matrix showing the various bondout options is shown in the table below.

The interconnect structure (GRP) is very similar to Lattice's existing ispLSI 1000, 2000 and 3000 families, but with an enhanced interconnect structure for optimal pin locking and logic routing. This eliminates the need for registered I/O cells or an Output Routing Pool.

The ispLSI 5000VE encompasses the innovative features of the ispLSI 5000VA family with several enhancements. The macrocell is optimized and the T-type flip flop option is removed. To improve the efficiency of design fits, the Product Term Reset Logic is simplified and the polarity option as well as the Global Preset function are removed. The programmable output-delay feature (skew option) is also removed. As a result, the ispLSI 5000VE is not JEDEC compatible with the ispLSI 5000VA. ispLSI 5000VA and 5000VE pinouts may differ in the same package, however all programming and power/ground pins are located in the same locations.

Note: Not all macrocells have I/O pads.

## Global Clock Distribution

The ispLSI 5000VE Family has four dedicated clock input pins: CLK0 - CLK3. CLK0 input is used as the dedicated master clock that has the lowest internal clock skew with no clock inversion to maintain the fastest internal clock

speed. The clock inversion is available on the remaining CLK1 - CLK3 signals. By sharing the pins with the I/O pins, CLK2 and CLK3 can not only be inverted but are also available for logic implementation through GRP signal routing. Figure 5 shows these different clock distribution options.

| SYMBOL       | PARAMETER                                                      | MIN  | MAX | UNITS |
|--------------|----------------------------------------------------------------|------|-----|-------|
| $t_{btcp}$   | TCK [BSCAN test] clock pulse width                             | 125  | –   | ns    |
| $t_{btch}$   | TCK [BSCAN test] pulse width high                              | 62.5 | –   | ns    |
| $t_{btcl}$   | TCK [BSCAN test] pulse width low                               | 62.5 | –   | ns    |
| $t_{btsu}$   | TCK [BSCAN test] setup time                                    | 25   | –   | ns    |
| $t_{bth}$    | TCK [BSCAN test] hold time                                     | 25   | –   | ns    |
| $t_{rf}$     | TCK [BSCAN test] rise and fall time                            | 50   | –   | mV/ns |
| $t_{btco}$   | TAP controller falling edge of clock to valid output           | –    | 25  | ns    |
| $t_{btuo}$   | TAP controller falling edge of clock to data output disable    | –    | 25  | ns    |
| $t_{btvo}$   | TAP controller falling edge of clock to data output enable     | –    | 25  | ns    |
| $t_{btcpso}$ | BSCAN test Capture register setup time                         | 25   | –   | ns    |
| $t_{btcpso}$ | BSCAN test Capture register hold time                          | 25   | –   | ns    |
| $t_{btuo}$   | BSCAN test Update reg, falling edge of clock to valid output   | –    | 50  | ns    |
| $t_{btuo}$   | BSCAN test Update reg, falling edge of clock to output disable | –    | 50  | ns    |
| $t_{btuo}$   | BSCAN test Update reg, falling edge of clock to output enable  | –    | 50  | ns    |

## Absolute Maximum Ratings <sup>1, 2</sup>

Supply Voltage  $V_{CC}$  ..... -0.5 to +5.4V  
 Input Voltage Applied ..... -0.5 to +5.6V  
 Tri-Stated Output Voltage Applied ..... -0.5 to +5.6V  
 Storage Temperature ..... -65 to 150°C  
 Case Temp. with Power Applied ..... -55 to 125°C  
 Max. Junction Temp. ( $T_J$ ) with Power Applied ... 150°C

1. Stresses above those listed under the "Absolute Maximum Ratings" may cause permanent damage to the device. Functional operation of the device at these or at any other conditions above those indicated in the operational sections of this specification is not implied (while programming, follow the programming specifications).
2. Compliance with the Thermal Management section of the Lattice Semiconductor Data Book or CD-ROM is a requirement.

## DC Recommended Operating Condition

| SYMBOL            | PARAMETER             |                                               | MIN. | MAX. | UNITS |
|-------------------|-----------------------|-----------------------------------------------|------|------|-------|
| V <sub>CC</sub>   | Supply Voltage        | Commercial    T <sub>A</sub> = 0°C to +70°C   | 3.00 | 3.60 | V     |
|                   |                       | Industrial    T <sub>A</sub> = -40°C to +85°C | 3.00 | 3.60 | V     |
| V <sub>CCIO</sub> | I/O Reference Voltage |                                               | 2.3  | 3.60 | V     |

1. Standard 16-bit counter using GRP feedback.

Timing Ext.5256ve2.eps

2. fmax (Toggle) may be less than 1/(twh + twl). This is to allow for a clock duty cycle of other than 50%.

Timing v.2.0

3. Reference Switching Test Conditions section.

4. Unless noted otherwise, all timing numbers are taken with worst case PTSA fanout, a GRP load of 1 GLB, CLK0, and high-speed AND array.

5. Timing parameters measured using normal active output driver.

6. The delay parameters are measured with Vcc as I/O voltage reference. An additional 0.5ns delay is incurred when Vccio is used as I/O reference.

7. Pulse widths less than minimum may cause unknown output behavior.  
used as I/O voltage reference.

<sup>1</sup>Timing for open drain configurations is the same as non-open drain configurations.

Timing Table/5256VE  
Timing v.2.0

Note: Internal Timing Parameters are not tested and are for reference only. Refer to Timing Model in this data sheet for details.

**ispLSI 5256VE Timing Model**

5000VE Timing Model

Note: *Italicized parameters are delay adders above and beyond default conditions (i.e. GRP load of one GLB, CLK0, high-speed AND Array and VCC I/O option).*

## Power Consumption

Power consumption in the ispLSI 5256VE device depends on two primary factors: the speed at which the device is operating and the number of product terms used. The product terms have a fuse-selectable speed/power tradeoff setting. Each group of five product terms has a single speed/power tradeoff control fuse that acts on the complete group of five. The fast “high-speed”

setting operates product terms at their normal full power consumption. For portions of the logic that can tolerate longer propagation delays, selecting the slower “low-power” setting will reduce the power dissipation for these product terms. Figure 10 shows the relationship between power and operating frequency.

**Figure 10. Typical Device Power Consumption vs fmax**

Notes: Configuration of 16 16-bit Counters  
Typical Current at 3.3V, 25° C

$I_{CC}$  can be estimated for the ispLSI 5256VE using the following equation:

**High Speed Mode:**  $I_{CC} = 21 + (\# \text{ of PTs} * 0.313) + (\# \text{ of nets} * F_{max} * 0.00282)$

**Low Power Mode:**  $I_{CC} = 21 + (\# \text{ of PTs} * 0.258) + (\# \text{ of nets} * F_{max} * 0.00282)$

# of PTs = Number of Product Terms used in design

# of nets = Number of Signals used in device

Fmax = Highest Clock Frequency to the device

The  $I_{CC}$  estimate is based on typical conditions ( $V_{CC} = 3.3V$ , room temperature) and an assumption of one GLB load on average exists. These values are for estimates only. Since the value of  $I_{CC}$  is sensitive to operating conditions and the program in the device, the actual  $I_{CC}$  should be verified.

0127/5256VE

## Signal Descriptions

| Signal Name               | Description                                                                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TMS                       | Input - This pin is the Test Mode Select input, which is used to control the JTAG state machine.                                                                                                                                                                                                                                      |
| TCK                       | Input - This pin is the Test Clock input pin used to clock through the JTAG state machine.                                                                                                                                                                                                                                            |
| TDI                       | Input - This pin is the JTAG Test Data In pin used to load data.                                                                                                                                                                                                                                                                      |
| TDO                       | Output - This pin is the JTAG Test Data Out pin used to shift data out.                                                                                                                                                                                                                                                               |
| TOE / I/O0                | Input/Output - This pin functions as either the Test Output Enable pin or an I/O pin based upon customer's design. TOE tristates all I/O pins when a logic low is driven.                                                                                                                                                             |
| GOE0, GOE1                | Input - These two pins are the Global Output Enable input pins.                                                                                                                                                                                                                                                                       |
| RESET                     | Dedicated Reset Input - This pin resets all registers in the device. The global polarity (active high or low input) for this pin is selectable.                                                                                                                                                                                       |
| I/O                       | Input/Output – These are the general purpose I/O used by the logic array.                                                                                                                                                                                                                                                             |
| GND                       | Ground                                                                                                                                                                                                                                                                                                                                |
| NC <sup>1</sup>           | No connect.                                                                                                                                                                                                                                                                                                                           |
| VCC                       | Vcc                                                                                                                                                                                                                                                                                                                                   |
| CLK0, CLK1                | Dedicated clock inputs for all registers. Both clocks are muxed before being used as the clock input to all registers in the device.                                                                                                                                                                                                  |
| CLK2 / I/O,<br>CLK3 / I/O | Input/Output - These pins share functionality. They can be used as dedicated clock inputs for all registers, as well as I/O pins.                                                                                                                                                                                                     |
| VCCIO                     | Input - This pin is used for optional 2.5V outputs. Every I/O can independently select either 3.3V or the optional voltage as its output level. If the optional output voltage is not required, this pin must be connected to the Vcc supply. Programmable pull-up resistors and bus-hold latches only draw current from this supply. |

1. NC pins are not to be connected to any active signals, VCC or GND.

Table 2-0041B/5256VE

The ispLSI 5256VE is dual-marked with both Commercial and Industrial grades. The Commercial speed grade is faster (i.e. ispLSI 5256VE-165LF256) than the Industrial speed grade (i.e. ispLSI 5256VE-125LF256I).
