Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	1377
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	228
Number of Gates	10000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Through Hole
Operating Temperature	-55°C ~ 125°C (TC)
Package / Case	257-BCPGA
Supplier Device Package	257-CPGA (50x50)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a14100a-1pg257m

1 – ACT 3 Family Overview

General Description

Microsemi's ACT 3 Accelerator Series of FPGAs offers the industry's fastest high-capacity programmable logic device. ACT 3 FPGAs offer a high performance, PCI compliant programmable solution capable of 186 MHz on-chip performance and 9.0 nanosecond clock-to-output (–1 speed grade), with capacities spanning from 1,500 to 10,000 gate array equivalent gates.

The ACT 3 family builds on the proven two-module architecture consisting of combinatorial and sequential logic modules used in Microsemi's 3200DX and 1200XL families. In addition, the ACT 3 I/O modules contain registers which deliver 9.0 nanosecond clock-to-out times (–1 speed grade). The devices contain four clock distribution networks, including dedicated array and I/O clocks, supporting very fast synchronous and asynchronous designs. In addition, routed clocks can be used to drive high fanout signals such as flip-flop resets and output.

The ACT 3 family is supported by Microsemi's Designer Series Development System which offers automatic placement and routing (with automatic or fixed pin assignments), static timing analysis, user programming, and debug and diagnostic probe capabilities.

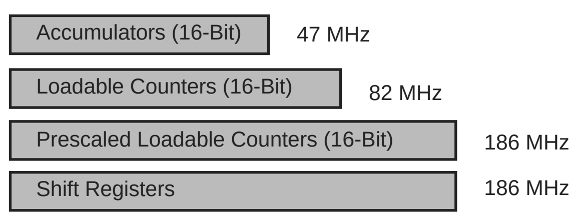

Figure 1-1 • **Predictable Performance (worst-case commercial, –1 speed grade)**

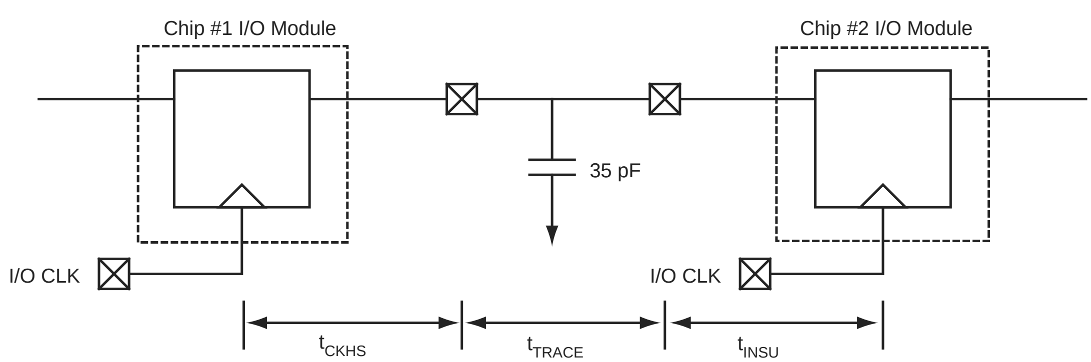
System Performance Model



Logic Modules

ACT 3 logic modules are enhanced versions of the 1200XL family logic modules. As in the 1200XL family, there are two types of modules: C-modules and S-modules (Figure 2-2 and Figure 2-3). The C-module is functionally equivalent to the 1200XL C-module and implements high fanin combinatorial macros, such as 5-input AND, 5-input OR, and so on. It is available for use as the CM8 hard macro. The S-module is designed to implement high-speed sequential functions within a single module.

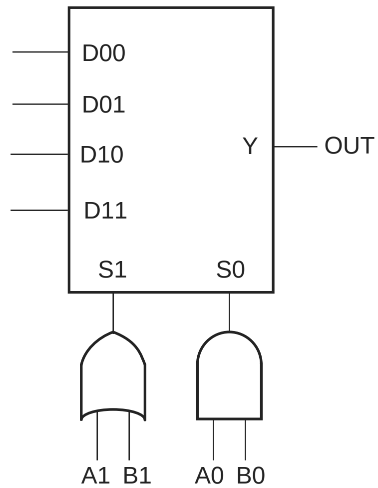


Figure 2-2 • **C-Module Diagram**

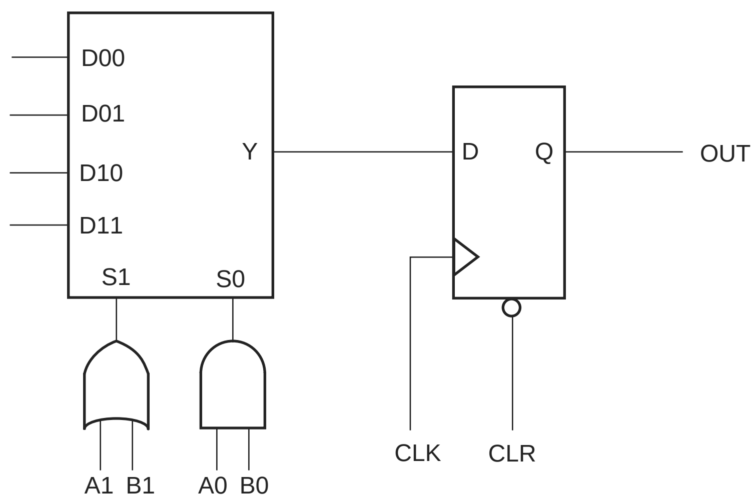

Figure 2-3 • **S-Module Diagram**

S-modules consist of a full C-module driving a flip-flop, which allows an additional level of logic to be implemented without additional propagation delay. It is available for use as the DFM8A/B and DLM8A/B hard macros. C-modules and S-modules are arranged in pairs called module-pairs. Module-pairs are arranged in alternating patterns and make up the bulk of the array. This arrangement allows the placement software to support two-module macros of four types (CC, CS, SC, and SS). The C-module implements the following function:

Y = !S1 * !S0 * D00 + !S1 * S0 * D01 + S1 * !S0 * D10 + S1 * S0 * D11

EQ 1

where: S0 = A0 * B0 and S1 = A1 + B1

The S-module contains a full implementation of the C-module plus a clearable sequential element that can either implement a latch or flip-flop function. The S-module can therefore implement any function implemented by the C-module. This allows complex combinatorial-sequential functions to be implemented with no delay penalty. The Designer Series Development System will automatically combine any C-module macro driving an S-module macro into the S-module, thereby freeing up a logic module and eliminating a module delay.

The clear input CLR is accessible from the routing channel. In addition, the clock input may be connected to one of three clock networks: CLKA, CLKB, or HCLK. The C-module and S-module functional descriptions are shown in Figure 2-2 and Figure 2-3 on page 2-2. The clock selection is determined by a multiplexer select at the clock input to the S-module.

I/Os

I/O Modules

I/O modules provide an interface between the array and the I/O Pad Drivers. I/O modules are located in the array and access the routing channels in a similar fashion to logic modules. The I/O module schematic is shown in Figure 4. The signals DataIn and DataOut connect to the I/O pad driver.

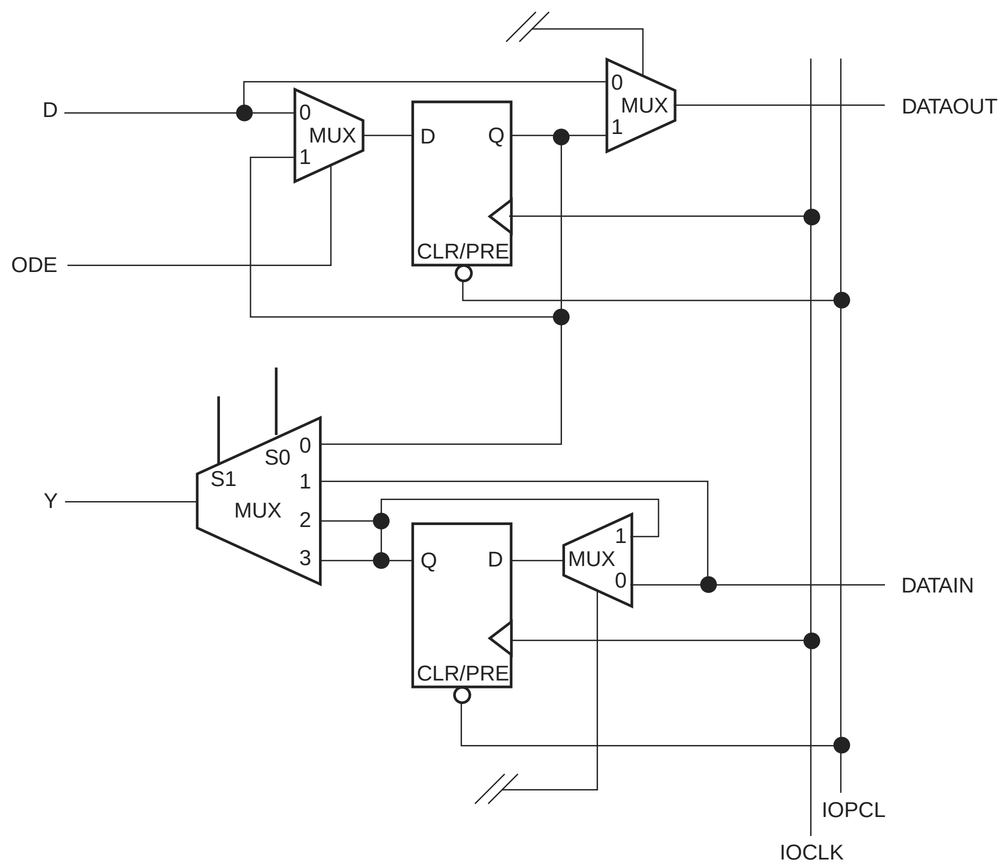

Figure 2-4 **• Functional Diagram for I/O Module**

Each I/O module contains two D-type flip-flops. Each flip-flop is connected to the dedicated I/O clock (IOCLK). Each flip-flop can be bypassed by nonsequential I/Os. In addition, each flip-flop contains a data enable input that can be accessed from the routing channels (ODE and IDE). The asynchronous preset/clear input is driven by the dedicated preset/clear network (IOPCL). Either preset or clear can be selected individually on an I/O module by I/O module basis.

The I/O module output Y is used to bring Pad signals into the array or to feed the output register back into the array. This allows the output register to be used in high-speed state machine applications. Side I/O modules have a dedicated output segment for Y extending into the routing channels above and below (similar to logic modules). Top/Bottom I/O modules have no dedicated output segment. Signals coming into the chip from the top or bottom are routed using F-fuses and LVTs (F-fuses and LVTs are explained in detail in the routing section).

I/O Pad Drivers

All pad drivers are capable of being tristate. Each buffer connects to an associated I/O module with four signals: OE (Output Enable), IE (Input Enable), DataOut, and DataIn. Certain special signals used only during programming and test also connect to the pad drivers: OUTEN (global output enable), INEN (global input enable), and SLEW (individual slew selection). See Figure 2-5.

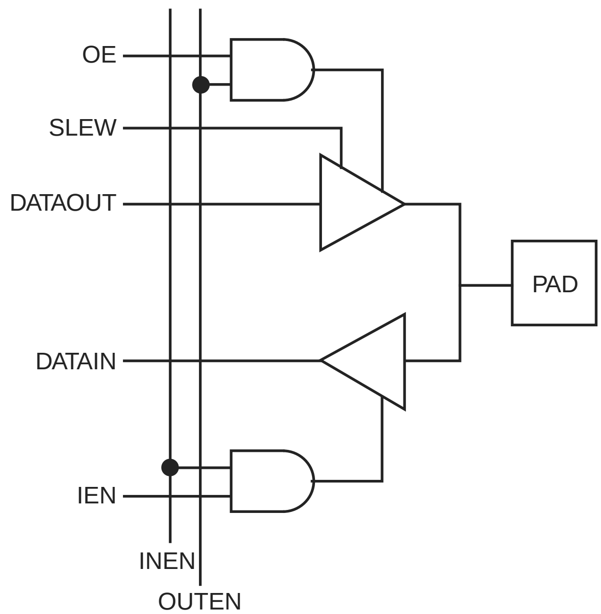

Figure 2-5 • **Function Diagram for I/O Pad Driver**

Special I/Os

The special I/Os are of two types: temporary and permanent. Temporary special I/Os are used during programming and testing. They function as normal I/Os when the MODE pin is inactive. Permanent special I/Os are user programmed as either normal I/Os or special I/Os. Their function does not change once the device has been programmed. The permanent special I/Os consist of the array clock input buffers (CLKA and CLKB), the hard-wired array clock input buffer (HCLK), the hard-wired I/O clock input buffer (IOCLK), and the hard-wired I/O register preset/clear input buffer (IOPCL). Their function is determined by the I/O macros selected.

Clock Networks

The ACT 3 architecture contains four clock networks: two high-performance dedicated clock networks and two general purpose routed networks. The high-performance networks function up to 200 MHz, while the general purpose routed networks function up to 150 MHz.

Horizontal Routing

Horizontal channels are located between the rows of modules and are composed of several routing tracks. The horizontal routing tracks within the channel are divided into one or more segments. The minimum horizontal segment length is the width of a module-pair, and the maximum horizontal segment length is the full length of the channel. Any segment that spans more than one-third the row length is considered a long horizontal segment. A typical channel is shown in Figure 2-7. Undedicated horizontal routing tracks are used to route signal nets. Dedicated routing tracks are used for the global clock networks and for power and ground tie-off tracks.

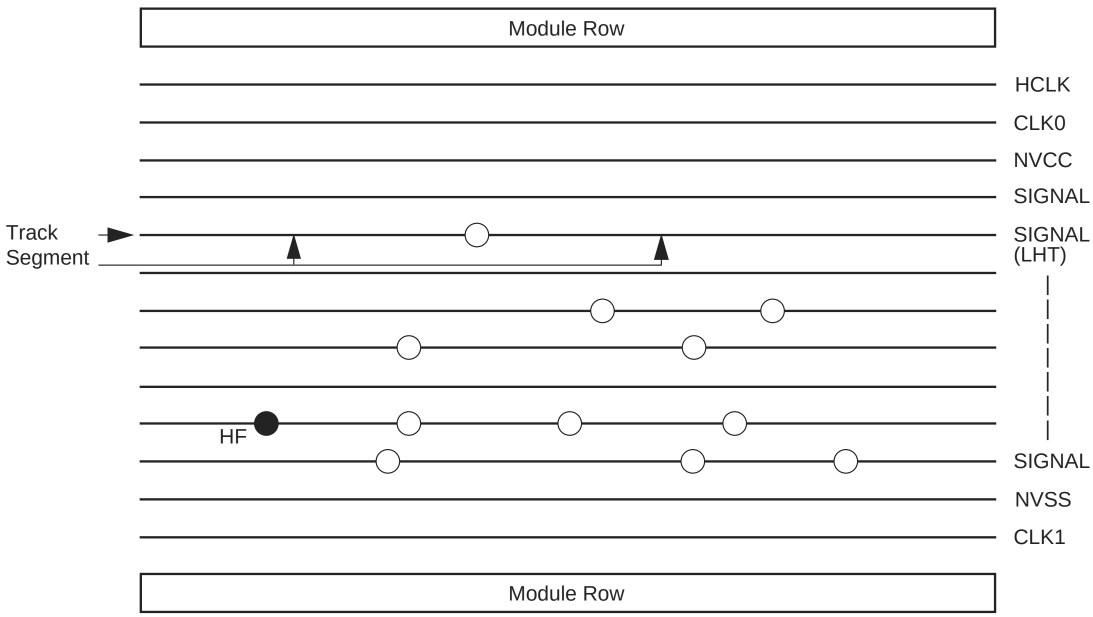

Figure 2-7 • **Horizontal Routing Tracks and Segments**

Vertical Routing

Other tracks run vertically through the modules. Vertical tracks are of three types: input, output, and long. Vertical tracks are also divided into one or more segments. Each segment in an input track is dedicated to the input of a particular module. Each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing. Each output segment spans four channels (two above and two below), except near the top and bottom of the array where edge effects occur. LVTs contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 2-8.

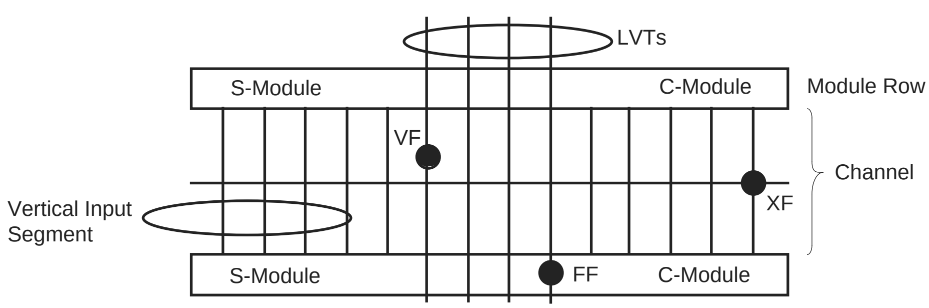

Figure 2-8 • **Vertical Routing Tracks and Segments**

5 V Operating Conditions

Table 2-2 • **Absolute Maximum Ratings[1], Free Air Temperature Range**

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	–0.5 to +7.0	V
VI	Input voltage	–0.5 to VCC + 0.5	V
VO	Output voltage	–0.5 to VCC + 0.5	V
IIO	I/O source sink current[2]	±20	mA
T_{STG}	Storage temperature	–65 to +150	°C

Notes:

1. *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.*
2. *Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND –0.5 V, the internal protection diodes will forward bias and can draw excessive current.*

Table 2-3 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature range*	0 to +70	–40 to +85	–55 to +125	°C
5 V power supply tolerance	±5	±10	±10	%VCC

*Note: *Ambient temperature (T_A) is used for commercial and industrial; case temperature (T_C) is used for military.*

Table 2-4 • **Electrical Specifications**

Symbol	Parameter	Test Condition	Commercial		Industrial		Military		Units
			Min.	Max.	Min.	Max.	Min.	Max.	
VOH[1,2]	High level output	IOH = –4 mA (CMOS)	–	–	3.7	–	3.7	–	V
		IOH = –6 mA (CMOS)	3.84						V
		IOH = –10 mA (TTL)[3]	2.40						V
VOL[1,2]	Low level output	IOL = +6 mA (CMOS)		0.33		0.4		0.4	V
		IOL = +12 mA (TTL)[3]		0.50					
VIH	High level input	TTL inputs	2.0	VCC + 0.3	2.0	VCC + 0.3	2.0	VCC + 0.3	V
VIL	Low level input	TTL inputs	–0.3	0.8	–0.3	0.8	–0.3	0.8	V
IIN	Input leakage	VI = VCC or GND	–10	+10	–10	+10	–10	+10	µA
IOZ	3-state output leakage	VO = VCC or GND	–10	+10	–10	+10	–10	+10	µA
C_{IO}	I/O capacitance[3,4]			10		10		10	pF
ICC(S)	Standby VCC supply current (typical = 0.7 mA)			2		10		20	mA
ICC(D)	Dynamic VCC supply current. See the Power Dissipation section.								

Notes:

1. *Microsemi devices can drive and receive either CMOS or TTL signal levels. No assignment of I/Os as TTL or CMOS is required.*
2. *Tested one output at a time, VCC = minimum.*
3. *Not tested; for information only.*
4. *VOUT = 0 V, f = 1 MHz*
5. *Typical standby current = 0.7 mA. All outputs unloaded. All inputs = VCC or GND.*

f_{MAX}	Flip-Flop Clock Frequency		200		150		125		100		75	MHz

Notes:

1. *VCC = 3.0 V for 3.3 V specifications.*
2. *For dual-module macros, use t_{PD} + t_{RD1} + t_{PDn} + t_{CO} + t_{RD1} + t_{PDn} or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.*
3. *The –2 and –3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at http://www.microsemi.com/soc/support/notifications/default.aspx#pdn.*
4. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

2	SDI, I/O	SDI, I/O
11	MODE	MODE
12	VCC	VCC
25	VCC	VCC
26	GND	GND
27	VCC	VCC
28	GND	GND
40	VCC	VCC
41	VCC	VCC
52	GND	GND
53	NC	I/O
60	VCC	VCC
65	NC	I/O
76	PRB, I/O	PRB, I/O
77	GND	GND
78	VCC	VCC
79	GND	GND
80	VCC	VCC
82	HCLK, I/O	HCLK, I/O
98	VCC	VCC
102	NC	I/O
103	SDO	SDO
104	IOPCL, I/O	IOPCL, I/O
105	GND	GND
114	VCC	VCC

PQ208, RQ208		
Pin Number	**A1460, A14V60 Function**	**A14100, A14V100 Function**
115	VCC	VCC
116	NC	I/O
129	GND	GND
130	VCC	VCC
131	GND	GND
132	VCC	VCC
145	VCC	VCC
146	GND	GND
147	NC	I/O
148	VCC	VCC
156	IOCLK, I/O	IOCLK, I/O
157	GND	GND
158	NC	I/O
164	VCC	VCC
180	CLKA, I/O	CLKA, I/O
181	CLKB, I/O	CLKB, I/O
182	VCC	VCC
183	GND	GND
184	VCC	VCC
185	GND	GND
186	PRA, I/O	PRA, I/O
195	NC	I/O
201	VCC	VCC
205	NC	I/O
208	DCLK, I/O	DCLK, I/O

Notes:
1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.
