

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	310
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	100
Number of Gates	2500
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1425a-1pq160i

ACT 3 Family Overview

General Description	1-1
---------------------------	-----

Detailed Specifications

Topology	2-1
Logic Modules	2-2
I/Os	2-3
Clock Networks	2-4
Routing Structure	2-5
5 V Operating Conditions	2-9
3.3 V Operating Conditions	2-10
Package Thermal Characteristics	2-11
ACT 3 Timing Model	2-16
Pin Descriptions	2-42

Package Pin Assignments

PL84	3-1
PQ100	3-3
PQ160	3-5
PQ208, RQ208	3-8
VQ100	3-12
CQ132	3-14
CQ196	3-16
CQ256	3-18
BG225	3-20
BG313	3-22
PG100	3-24
PG133	3-26
PG175	3-28
PG207	3-30
PG257	3-32

Datasheet Information

List of Changes	4-1
Datasheet Categories	4-3
Safety Critical, Life Support, and High-Reliability Applications Policy	4-3

The I/O module output Y is used to bring Pad signals into the array or to feed the output register back into the array. This allows the output register to be used in high-speed state machine applications. Side I/O modules have a dedicated output segment for Y extending into the routing channels above and below (similar to logic modules). Top/Bottom I/O modules have no dedicated output segment. Signals coming into the chip from the top or bottom are routed using F-fuses and LVTs (F-fuses and LVTs are explained in detail in the routing section).

I/O Pad Drivers

All pad drivers are capable of being tristate. Each buffer connects to an associated I/O module with four signals: OE (Output Enable), IE (Input Enable), DataOut, and DataIn. Certain special signals used only during programming and test also connect to the pad drivers: OUTEN (global output enable), INEN (global input enable), and SLEW (individual slew selection). See [Figure 2-5](#).

Figure 2-5 • Function Diagram for I/O Pad Driver

Special I/Os

The special I/Os are of two types: temporary and permanent. Temporary special I/Os are used during programming and testing. They function as normal I/Os when the MODE pin is inactive. Permanent special I/Os are user programmed as either normal I/Os or special I/Os. Their function does not change once the device has been programmed. The permanent special I/Os consist of the array clock input buffers (CLKA and CLKB), the hard-wired array clock input buffer (HCLK), the hard-wired I/O clock input buffer (IOCLK), and the hard-wired I/O register preset/clear input buffer (IOPCL). Their function is determined by the I/O macros selected.

Clock Networks

The ACT 3 architecture contains four clock networks: two high-performance dedicated clock networks and two general purpose routed networks. The high-performance networks function up to 200 MHz, while the general purpose routed networks function up to 150 MHz.

3.3 V Operating Conditions

Table 2-5 • Absolute Maximum Ratings¹, Free Air Temperature Range

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	−0.5 to +7.0	V
VI	Input voltage	−0.5 to VCC + 0.5	V
VO	Output voltage	−0.5 to VCC + 0.5	V
IIO	I/O source sink current ²	±20	mA
T _{STG}	Storage temperature	−65 to +150	°C

Notes:

1. Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.
2. Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND −0.5 V, the internal protection diodes will forward bias and can draw excessive current.

Table 2-6 • Recommended Operating Conditions

Parameter	Commercial	Units
Temperature range*	0 to +70	°C
Power supply tolerance	3.0 to 3.6	V

Note: *Ambient temperature (T_A) is used for commercial.

Table 2-7 • Electrical Specifications

Parameter		Commercial		Units
		Min.	Max.	
VOH ¹	I _{OH} = −4 mA	2.15	–	V
	I _{OH} = −3.2 mA	2.4		V
VOL ¹	I _{OL} = 6 mA		0.4	V
VIL		−0.3	0.8	V
VIH		2.0	VCC + 0.3	V
Input transition time t_R , t_F ²	VI = VCC or GND	−10	+10	μA
C _{IO} I/O Capacitance ^{2,3}			10	pF
Standby current, ICC ⁴ (typical = 0.3 mA)			0.75	mA
Leakage current ⁵		−10	10	μA

1. Only one output tested at a time. VCC = minimum.
2. Not tested; for information only.
3. Includes worst-case 84-pin PLCC package capacitance. VOUT = 0 V, f = 1 MHz.
4. Typical standby current = 0.3 mA. All outputs unloaded. All inputs = VCC or GND.
5. VO, VIN = VCC or GND

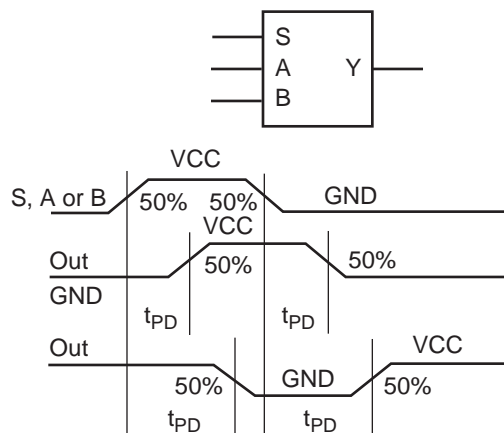

Figure 2-14 • Module Delays

Flip-Flops

Figure 2-15 • Sequential Module Timing Characteristics

Tightest Delay Distributions

Propagation delay between logic modules depends on the resistive and capacitive loading of the routing tracks, the interconnect elements, and the module inputs being driven. Propagation delay increases as the length of routing tracks, the number of interconnect elements, or the number of inputs increases.

From a design perspective, the propagation delay can be statistically correlated or modeled by the fanout (number of loads) driven by a module. Higher fanout usually requires some paths to have longer lengths of routing track. The ACT 3 family delivers the tightest fanout delay distribution of any FPGA. This tight distribution is achieved in two ways: by decreasing the delay of the interconnect elements and by decreasing the number of interconnect elements per path.

Microsemi's patented PLICE antifuse offers a very low resistive/capacitive interconnect. The ACT 3 family's antifuses, fabricated in 0.8 micron m lithography, offer nominal levels of 200 Ω resistance and 6 femtofarad (fF) capacitance per antifuse. The ACT 3 fanout distribution is also tighter than alternative devices due to the low number of antifuses required per interconnect path. The ACT 3 family's proprietary architecture limits the number of antifuses per path to only four, with 90% of interconnects using only two antifuses.

The ACT 3 family's tight fanout delay distribution offers an FPGA design environment in which fanout can be traded for the increased performance of reduced logic level designs. This also simplifies performance estimates when designing with ACT 3 devices.

Table 2-14 • Logic Module and Routing Delay by Fanout (ns); Worst-Case Commercial Conditions

Speed Grade	FO = 1	FO = 2	FO = 3	FO = 4	FO = 8
ACT 3 –3	2.9	3.2	3.4	3.7	4.8
ACT 3 –2	3.3	3.7	3.9	4.2	5.5
ACT 3 –1	3.7	4.2	4.4	4.8	6.2
ACT 3 STD	4.3	4.8	5.1	5.5	7.2

Notes:

1. Obtained by added $t_{RD(x=FO)}$ to t_{PD} from the Logic Module Timing Characteristics Tables found in this datasheet.
2. The –2 and –3 speed grades have been discontinued. Refer to [PDN 0104](#), [PDN 0203](#), [PDN 0604](#), and [PDN 1004](#) at <http://www.microsemi.com/soc/support/notifications/default.aspx#pdn>.

Timing Characteristics

Timing characteristics for ACT 3 devices fall into three categories: family dependent, device dependent, and design dependent. The input and output buffer characteristics are common to all ACT 3 family members. Internal routing delays are device dependent. Design dependency means actual delays are not determined until after placement and routing of the user's design is complete. Delay values may then be determined by using the ALS Timer utility or performing simulation with post-layout delays.

Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most time-critical paths. Critical nets are determined by net property assignment prior to placement and routing. Up to 6% of the nets in a design may be designated as critical, while 90% of the nets in a design are typical.

Long Tracks

Some nets in the design use long tracks. Long tracks are special routing resources that span multiple rows, columns, or modules. Long tracks employ three and sometimes four antifuse connections. This increases capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically up to 6% of nets in a fully utilized device require long tracks. Long tracks contribute approximately 4 ns to 14 ns delay. This additional delay is represented statistically in higher fanout (FO = 8) routing delays in the datasheet specifications section.

Timing Derating

ACT 3 devices are manufactured in a CMOS process. Therefore, device performance varies according to temperature, voltage, and process variations. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing.

Table 2-15 • Timing Derating Factor (Temperature and Voltage)

(Commercial Minimum/Maximum Specification) x	Industrial		Military	
	Min.	Max.	Min.	Max.
	0.66	1.07	0.63	1.17

Table 2-16 • Timing Derating Factor for Designs at Typical Temperature ($T_J = 25^\circ\text{C}$) and Voltage (5.0 V)

(Commercial Maximum Specification) x	0.85
--------------------------------------	------

Table 2-17 • Temperature and Voltage Derating Factors (normalized to Worst-Case Commercial, $T_J = 4.75\text{ V}, 70^\circ\text{C}$)

	-55	-40	0	25	70	85	125
4.50	0.72	0.76	0.85	0.90	1.04	1.07	1.117
4.75	0.70	0.73	0.82	0.87	1.00	1.03	1.12
5.00	0.68	0.71	0.79	0.84	0.97	1.00	1.09
5.25	0.66	0.69	0.77	0.82	0.94	0.97	1.06
5.50	0.63	0.66	0.74	0.79	0.90	0.93	1.01

Note: This derating factor applies to all routing and propagation delays.

Figure 2-18 • Junction Temperature and Voltage Derating Curves (normalized to Worst-Case Commercial, $T_J = 4.75\text{ V}, 70^\circ\text{C}$)

Notes:

- The –2 and –3 speed grades have been discontinued. Refer to [PDN 0104](#), [PDN 0203](#), [PDN 0604](#), and [PDN 1004](#) at <http://www.microsemi.com/soc/support/notifications/default.aspx#pdn>.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

Pin Number	A1440, A14V40 Function	A1460, A14V60 Function	Pin Number	A1440, A14V40 Function	A1460, A14V60 Function
1	GND	GND	89	GND	GND
2	SDI, I/O	SDI, I/O	98	VCC	VCC
10	MODE	MODE	99	VCC	VCC
11	VCC	VCC	108	GND	GND
20	NC	I/O	109	VCC	VCC
21	GND	GND	110	GND	GND
22	VCC	VCC	119	NC	I/O
23	GND	GND	121	NC	I/O
32	VCC	VCC	122	VCC	VCC
33	VCC	VCC	123	GND	GND
44	GND	GND	124	VCC	VCC
49	NC	I/O	132	IOCLK, I/O	IOCLK, I/O
51	NC	I/O	133	GND	GND
63	NC	I/O	138	NC	I/O
64	PRB, I/O	PRB, I/O	152	CLKA, I/O	CLKA, I/O
65	GND	GND	153	CLKB, I/O	CLKB, I/O
66	VCC	VCC	154	VCC	VCC
67	VCC	VCC	155	GND	GND
69	HCLK, I/O	HCLK, I/O	156	VCC	VCC
82	NC	I/O	157	PRA, I/O	PRA, I/O
83	NC	I/O	158	NC	I/O
87	SDO	SDO	170	NC	I/O
88	IOPCL, I/O	IOPCL, I/O	176	DCLK, I/O	DCLK, I/O

Notes:

1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
