Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	310
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	80
Number of Gates	2500
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	100-BQFP
Supplier Device Package	100-PQFP (20x14)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1425a-pq100c

Ordering Information

Notes:

1. The -2 and -3 speed grades have been discontinued.
2. The Ceramic Pin Grid Array packages PG100, PG133, and PG175 have been discontinued in all device densities, speed grades, and temperature grades.
3. The Plastic Ball Grid Array package BG225 has been discontinued in all device densities (specifically for A1460A), all speed grades, and all temperature grades.
4. Military Grade devices are no longer available for the A1440A device.
5. For more information about discontinued devices, refer to the Product Discontinuation Notices (PDNs) listed below, available on the Microsemi SoC Products Group website:
PDN March 2001
PDN 0104
PDN 0203
PDN 0604
PDN 1004

Contact your local Microsemi SoC Products Group (formerly Actel) representative for device availability:

<http://www.microsemi.com/soc/contact/default.aspx>.

The I/O module output Y is used to bring Pad signals into the array or to feed the output register back into the array. This allows the output register to be used in high-speed state machine applications. Side I/O modules have a dedicated output segment for Y extending into the routing channels above and below (similar to logic modules). Top/Bottom I/O modules have no dedicated output segment. Signals coming into the chip from the top or bottom are routed using F-fuses and LVTs (F-fuses and LVTs are explained in detail in the routing section).

I/O Pad Drivers

All pad drivers are capable of being tristate. Each buffer connects to an associated I/O module with four signals: OE (Output Enable), IE (Input Enable), DataOut, and DataIn. Certain special signals used only during programming and test also connect to the pad drivers: OUTEN (global output enable), INEN (global input enable), and SLEW (individual slew selection). See Figure 2-5.

Figure 2-5 • Function Diagram for I/O Pad Driver

Special I/Os

The special I/Os are of two types: temporary and permanent. Temporary special I/Os are used during programming and testing. They function as normal I/Os when the MODE pin is inactive. Permanent special I/Os are user programmed as either normal I/Os or special I/Os. Their function does not change once the device has been programmed. The permanent special I/Os consist of the array clock input buffers (CLKA and CLKB), the hard-wired array clock input buffer (HCLK), the hard-wired I/O clock input buffer (IOCLK), and the hard-wired I/O register preset/clear input buffer (IOPCL). Their function is determined by the I/O macros selected.

Clock Networks

The ACT 3 architecture contains four clock networks: two high-performance dedicated clock networks and two general purpose routed networks. The high-performance networks function up to 200 MHz, while the general purpose routed networks function up to 150 MHz.

Figure 2-16 • I/O Module: Sequential Input Timing Characteristics

Figure 2-17 • I/O Module: Sequential Output Timing Characteristics

Tightest Delay Distributions

Propagation delay between logic modules depends on the resistive and capacitive loading of the routing tracks, the interconnect elements, and the module inputs being driven. Propagation delay increases as the length of routing tracks, the number of interconnect elements, or the number of inputs increases.

From a design perspective, the propagation delay can be statistically correlated or modeled by the fanout (number of loads) driven by a module. Higher fanout usually requires some paths to have longer lengths of routing track. The ACT 3 family delivers the tightest fanout delay distribution of any FPGA. This tight distribution is achieved in two ways: by decreasing the delay of the interconnect elements and by decreasing the number of interconnect elements per path.

Microsemi's patented PLICE antifuse offers a very low resistive/capacitive interconnect. The ACT 3 family's antifuses, fabricated in 0.8 micron m lithography, offer nominal levels of 200Ω resistance and 6 femtofarad (fF) capacitance per antifuse. The ACT 3 fanout distribution is also tighter than alternative devices due to the low number of antifuses required per interconnect path. The ACT 3 family's proprietary architecture limits the number of antifuses per path to only four, with 90% of interconnects using only two antifuses.

The ACT 3 family's tight fanout delay distribution offers an FPGA design environment in which fanout can be traded for the increased performance of reduced logic level designs. This also simplifies performance estimates when designing with ACT 3 devices.

Table 2-14 • Logic Module and Routing Delay by Fanout (ns); Worst-Case Commercial Conditions

Speed Grade	FO = 1	FO = 2	FO = 3	FO = 4	FO = 8
ACT 3 –3	2.9	3.2	3.4	3.7	4.8
ACT 3 –2	3.3	3.7	3.9	4.2	5.5
ACT 3 –1	3.7	4.2	4.4	4.8	6.2
ACT 3 STD	4.3	4.8	5.1	5.5	7.2

Notes:

1. Obtained by added $t_{RD(x=FO)}$ to t_{PD} from the Logic Module Timing Characteristics Tables found in this datasheet.
2. The –2 and –3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at <http://www.microsemi.com/soc/support/notifications/default.aspx#pdn>.

Timing Characteristics

Timing characteristics for ACT 3 devices fall into three categories: family dependent, device dependent, and design dependent. The input and output buffer characteristics are common to all ACT 3 family members. Internal routing delays are device dependent. Design dependency means actual delays are not determined until after placement and routing of the user's design is complete. Delay values may then be determined by using the ALS Timer utility or performing simulation with post-layout delays.

Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most time-critical paths. Critical nets are determined by net property assignment prior to placement and routing. Up to 6% of the nets in a design may be designated as critical, while 90% of the nets in a design are typical.

Long Tracks

Some nets in the design use long tracks. Long tracks are special routing resources that span multiple rows, columns, or modules. Long tracks employ three and sometimes four antifuse connections. This increases capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically up to 6% of nets in a fully utilized device require long tracks. Long tracks contribute approximately 4 ns to 14 ns delay. This additional delay is represented statistically in higher fanout (FO = 8) routing delays in the datasheet specifications section.

A1415A, A14V15A Timing Characteristics

Table 2-18 • A1415A, A14V15A Worst-Case Commercial Conditions, VCC = 4.75 V, T_J = 70°C¹

Logic Module Propagation Delays ²		–3 Speed ³		–2 Speed ³		–1 Speed		Std. Speed		3.3 V Speed ¹		Units
Parameter/Description		Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Min.	Max.

t _A	Flip-Flop Clock Input Period	4.0		5.0		6.8		8.0		10.0		ns
f _{MAX}	Flip-Flop Clock Frequency		250		200		150		125		100	MHz

Notes:

- VCC = 3.0 V for 3.3 V specifications.
- For dual-module macros, use t_{PD} + t_{RD1} + t_{PDn} + t_{CO} + t_{RD1} + t_{PDn} or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.
- The –2 and –3 speed grades have been discontinued. Please refer to the Product Discontinuation Notices (PDNs) listed below:
PDN March 2001
PDN 0104
PDN 0203
PDN 0604
PDN 1004
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

4. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

Pin Descriptions

CLKA **Clock A (Input)**

Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

CLKB **Clock B (Input)**

Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

GND **Ground**

LOW supply voltage.

HCLK **Dedicated (Hard-wired) Array Clock (Input)**

Clock input for sequential modules. This input is directly wired to each S-Module and offers clock speeds independent of the number of S-Modules being driven. This pin can also be used as an I/O.

I/O **Input/Output (Input, Output)**

The I/O pin functions as an input, output, three-state, or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/O pins are tristated by the Designer Series software.

IOCLK **Dedicated (Hard-wired) I/O Clock (Input)**

Clock input for I/O modules. This input is directly wired to each I/O module and offers clock speeds independent of the number of I/O modules being driven. This pin can also be used as an I/O.

IOPCL **Dedicated (Hard-wired) I/O Preset/Clear (Input)**

Input for I/O preset or clear. This global input is directly wired to the preset and clear inputs of all I/O registers. This pin functions as an I/O when no I/O preset or clear macros are used.

MODE **Mode (Input)**

The MODE pin controls the use of diagnostic pins (DCLK, PRA, PRB, SDI). When the MODE pin is HIGH, the special functions are active. When the MODE pin is LOW, the pins function as I/Os. To provide Actionprobe capability, the MODE pin should be terminated to GND through a 10K resistor so that the MODE pin can be pulled high when required.

NC **No Connection**

This pin is not connected to circuitry within the device.

PRA **Probe A (Output)**

The Probe A pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe B pin to allow real-time diagnostic output of any signal path within the device. The Probe A pin can be used as a user-defined I/O when debugging has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. PRA is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

PRB **Probe B (Output)**

The Probe B pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe A pin to allow real-time diagnostic output of any signal path within the device. The Probe B pin can be used as a user-defined I/O when debugging has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. PRB is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDI **Serial Data Input (Input)**

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDO Serial Data Output (Output)

Serial data output for diagnostic probe. SDO is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

DCLK Diagnostic Clock (Input)

Clock input for diagnostic probe and device programming. DCLK is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

VCC 5 V Supply Voltage

HIGH supply voltage.

1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

4 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the datasheet.

Revision	Changes	Page
Revision 3 (January 2012)	The description for SDO pins had earlier been removed from the datasheet and has now been included again, in the "Pin Descriptions" section (SAR 35820).	2-21
	SDO pin numbers had earlier been removed from package pin assignment tables in the datasheet, and have now been restored to the pin tables (SAR 35820).	3-1
Revision 2 (September 2011)	The ACT 3 datasheet was formatted newly in the style used for current datasheets. The same information is present (other than noted in the list of changes for this revision) but divided into chapters.	N/A
	The datasheet was revised to note in multiple places that speed grades –2 and –3 have been discontinued. The following device/package combinations have been discontinued for all speed grades and temperatures (SAR 33872): A1415 PG100 A1425 PG133 A1440 PG175 A1460 BG225 Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004.	I and others
	The "Features" section was revised to state the clock-to-output time and on-chip performance for –1 speed grade as 9.0 ns and 186 MHz. The "General Description" section was revised in accordance (SAR 33872).	I
	The maximum performance values were updated in Table 1 • ACT 3 Family Product Information, and now reflect worst-case commercial for the –1 speed grade (SAR 33872).	I
	The "Product Plan" table was updated as follows to conform to current offerings (SAR 33872): The A1415A device is offered in PL84, PG100, and VQ100 packages for Military application. The A1440A device is offered in TQ176 and VQ100 packages for Industrial application.	III
	Table 1-1 • Chip-to-Chip Performance (worst-case commercial) was updated to include data for all speed grades instead of only –3 (SAR 33872).	1-2
	Figure 1-1 • Predictable Performance (worst-case commercial, –1 speed grade) was revised to reflect values for the –1 speed grade (SAR 33872).	1-1
	Figure 2-10 • Timing Model was updated to show data for the –1 speed grade instead of –3 (SAR 33872).	2-16
	Table 2-14 • Logic Module and Routing Delay by Fanout (ns); Worst-Case Commercial Conditions was updated to include data for all speed grades instead of only –3 (SAR 33872).	2-20
	Package names used in the "Package Pin Assignments" section and throughout the document were revised to match standards given in <i>Package Mechanical Drawings</i> (SAR 27395).	3-1
