Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	310
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	100
Number of Gates	2500
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1425a-pqg160c

Product Plan

Device/Package	Speed Grade[1]				Application[1]			
	Std.	–1	–2	–3	C	I	M	B
A1415A Device								
84-Pin Plastic Leaded Chip Carrier (PLCC)	✓	✓	D	D	✓	✓	✓	–
100-Pin Plastic Quad Flatpack (PQFP)	✓	✓	D	D	✓	✓	✓	–
100-Pin Very Thin Quad Flatpack (VQFP)	✓	✓	D	D	✓	✓	✓	–
100-Pin Ceramic Pin Grid Array (CPGA)	D	D	D	D	D	–	–	–
A14V15A Device

160-Pin Plastic Quad Flatpack (PQFP)	✓	–	–	–	✓	–	–	–
A1440A Device								
84-Pin Plastic Leaded Chip Carrier (PLCC)	✓	✓	D	D	✓	✓	–	–
100-Pin Very Thin Quad Flatpack (VQFP)	✓	✓	D	D	✓	✓	–	–
160-Pin Plastic Quad Flatpack (PQFP)	✓	✓	D	D	✓	✓	–	–
175-Pin Ceramic Pin Grid Array (CPGA)	D	D	D	D	D	–	–	–
176-Pin Thin Quad Flatpack (TQFP)	✓	✓	D	D	✓	✓	–	–

Notes:
1. *Applications:*
   C = Commercial
   I = Industrial
   M = Military
2. *Commercial only*

Availability:
✓ = Available
P = Planned
– = Not planned
D = Discontinued

Speed Grade:
–1 = Approx. 15% faster than Std.
–2 = Approx. 25% faster than Std.
–3 = Approx. 35% faster than Std.
(–2 and –3 speed grades have been discontinued.)

2 – Detailed Specifications

This section of the datasheet is meant to familiarize the user with the architecture of the ACT 3 family of FPGA devices. A generic description of the family will be presented first, followed by a detailed description of the logic blocks, the routing structure, the antifuses, and the special function circuits. The on-chip circuitry required to program the devices is not covered.

Topology

The ACT 3 family architecture is composed of six key elements: Logic modules, I/O modules, I/O Pad Drivers, Routing Tracks, Clock Networks, and Programming and Test Circuits. The basic structure is similar for all devices in the family, differing only in the number of rows, columns, and I/Os. The array itself consists of alternating rows of modules and channels. The logic modules and channels are in the center of the array; the I/O modules are located along the array periphery. A simplified floor plan is depicted in Figure 2-1.

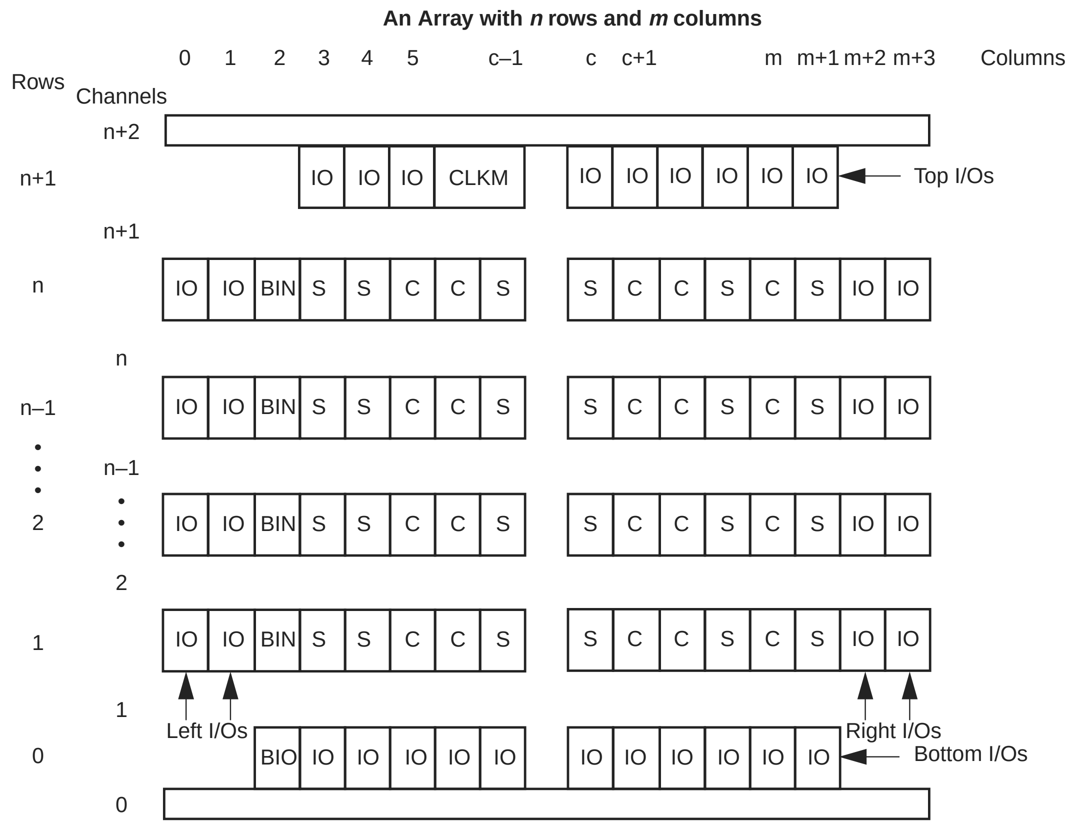

Figure 2-1 • **Generalized Floor Plan of ACT 3 Device**

The I/O module output Y is used to bring Pad signals into the array or to feed the output register back into the array. This allows the output register to be used in high-speed state machine applications. Side I/O modules have a dedicated output segment for Y extending into the routing channels above and below (similar to logic modules). Top/Bottom I/O modules have no dedicated output segment. Signals coming into the chip from the top or bottom are routed using F-fuses and LVTs (F-fuses and LVTs are explained in detail in the routing section).

I/O Pad Drivers

All pad drivers are capable of being tristate. Each buffer connects to an associated I/O module with four signals: OE (Output Enable), IE (Input Enable), DataOut, and DataIn. Certain special signals used only during programming and test also connect to the pad drivers: OUTEN (global output enable), INEN (global input enable), and SLEW (individual slew selection). See Figure 2-5.

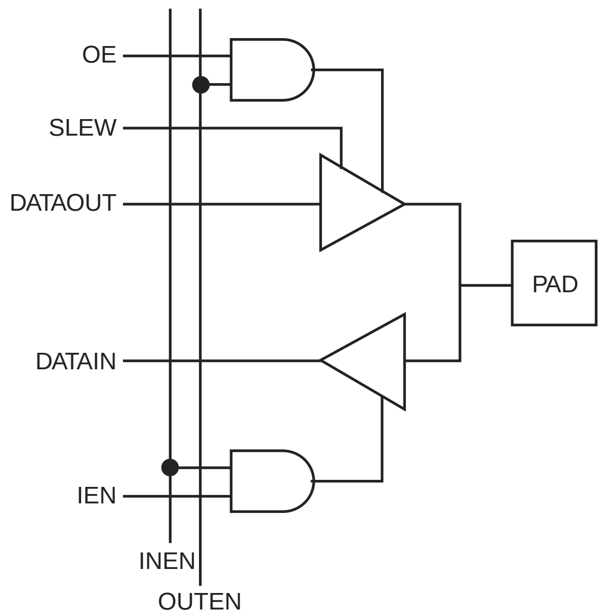

Figure 2-5 • **Function Diagram for I/O Pad Driver**

Special I/Os

The special I/Os are of two types: temporary and permanent. Temporary special I/Os are used during programming and testing. They function as normal I/Os when the MODE pin is inactive. Permanent special I/Os are user programmed as either normal I/Os or special I/Os. Their function does not change once the device has been programmed. The permanent special I/Os consist of the array clock input buffers (CLKA and CLKB), the hard-wired array clock input buffer (HCLK), the hard-wired I/O clock input buffer (IOCLK), and the hard-wired I/O register preset/clear input buffer (IOPCL). Their function is determined by the I/O macros selected.

Clock Networks

The ACT 3 architecture contains four clock networks: two high-performance dedicated clock networks and two general purpose routed networks. The high-performance networks function up to 200 MHz, while the general purpose routed networks function up to 150 MHz.

Module Output Connections

Module outputs have dedicated output segments. Output segments extend vertically two channels above and two channels below, except at the top or bottom of the array. Output segments twist, as shown in Figure 10, so that only four vertical tracks are required.

LVT Connections

Outputs may also connect to nondedicated segments called Long Vertical Tracks (LVTs). Each module pair in the array shares four LVTs that span the length of the column. Any module in the column pair can connect to one of the LVTs in the column using an FF connection. The FF connection uses antifuses connected directly to the driver stage of the module output, bypassing the isolation transistor. FF antifuses are programmed at a higher current level than HF, VF, or XF antifuses to produce a lower resistance value.

Antifuse Connections

In general every intersection of a vertical segment and a horizontal segment contains an unprogrammed antifuse (XF-type). One exception is in the case of the clock networks.

Clock Connections

To minimize loading on the clock networks, a subset of inputs has antifuses on the clock tracks. Only a few of the C-module and S-module inputs can be connected to the clock networks. To further reduce loading on the clock network, only a subset of the horizontal routing tracks can connect to the clock inputs of the S-module.

Programming and Test Circuits

The array of logic and I/O modules is surrounded by test and programming circuits controlled by the temporary special I/O pins MODE, SDI, and DCLK. The function of these pins is similar to all ACT family devices. The ACT 3 family also includes support for two Actionprobe® circuits, allowing complete observability of any logic or I/O module in the array using the temporary special I/O pins, PRA and PRB.

3.3 V Operating Conditions

Table 2-5 • Absolute Maximum Ratings[1], Free Air Temperature Range

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	–0.5 to +7.0	V
VI	Input voltage	–0.5 to VCC + 0.5	V
VO	Output voltage	–0.5 to VCC + 0.5	V
IIO	I/O source sink current[2]	±20	mA
T_{STG}	Storage temperature	–65 to +150	°C

Notes:

1. *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.*
2. *Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND –0.5 V, the internal protection diodes will forward bias and can draw excessive current.*

Table 2-6 • Recommended Operating Conditions

Parameter	Commercial	Units
Temperature range*	0 to +70	°C
Power supply tolerance	3.0 to 3.6	V

*Note: *Ambient temperature (T_A) is used for commercial.*

Table 2-7 • Electrical Specifications

Parameter		Commercial		Units
		Min.	Max.	
VOH[1]	IOH = –4 mA	2.15	–	V
	IOH = –3.2 mA	2.4		V
VOL[1]	IOL = 6 mA		0.4	V
VIL		–0.3	0.8	V
VIH		2.0	VCC + 0.3	V
Input transition time t_R, t_F[2]	VI = VCC or GND	–10	+10	µA
C_{IO} I/O Capacitance[2,3]			10	pF
Standby current, ICC[4] (typical = 0.3 mA)			0.75	mA
Leakage current[5]		–10	10	µA

1. *Only one output tested at a time. VCC = minimum.*
2. *Not tested; for information only.*
3. *Includes worst-case 84-pin PLCC package capacitance. VOUT = 0 V, f - 1 MHz.*
4. *Typical standby current = 0.3 mA. All outputs unloaded. All inputs = VCC or GND.*
5. *VO, VIN = VCC or GND*

A1415A, A14V15A Timing Characteristics (continued)

2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

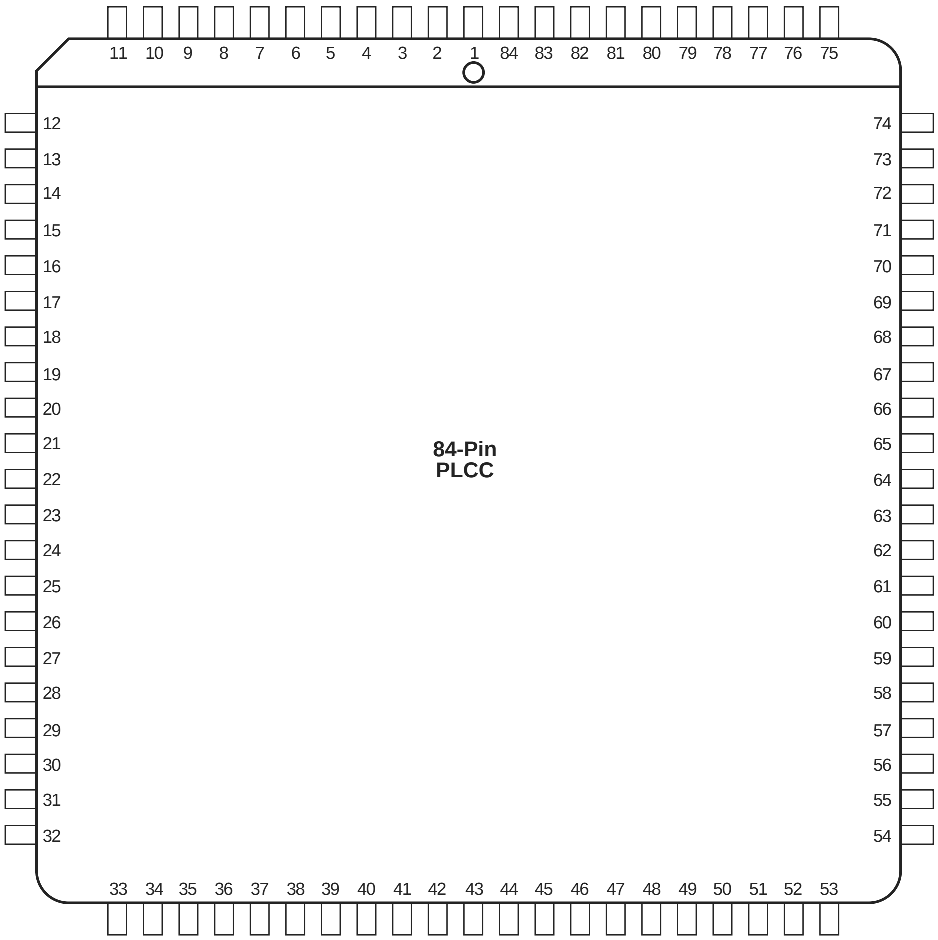
3 – Package Pin Assignments

PL84



Note: This is the top view of the package.

PQ100		
Pin Number	**A1415 Function**	**A1425 Function**
2	IOCLK, I/O	IOCLK, I/O
14	CLKA, I/O	CLKA, I/O
15	CLKB, I/O	CLKB, I/O
16	VCC	VCC
17	GND	GND
18	VCC	VCC
19	GND	GND
20	PRA, I/O	PRA, I/O
27	DCLK, I/O	DCLK, I/O
28	GND	GND
29	SDI, I/O	SDI, I/O
34	MODE	MODE
35	VCC	VCC
36	GND	GND
47	GND	GND
48	VCC	VCC
61	PRB, I/O	PRB, I/O
62	GND	GND
63	VCC	VCC
64	GND	GND
65	VCC	VCC
67	HCLK, I/O	HCLK, I/O
77	SDO	SDO
78	IOPCL, I/O	IOPCL, I/O
79	GND	GND
85	VCC	VCC
86	VCC	VCC
87	GND	GND
96	VCC	VCC
97	GND	GND

Notes:

1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

CQ132		CQ132	
Pin Number	**A1425 Function**	**Pin Number**	**A1425 Function**
1	NC	67	NC
2	GND	74	GND
