Microsemi Corporation - A1460A-1PQG208I Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	848
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	167
Number of Gates	6000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1460a-1pqg208i

Product Plan

Device/Package	Speed Grade[1]				Application[1]

Antifuse Connections

An antifuse is a "normally open" structure as opposed to the normally closed fuse structure used in PROMs or PALs. The use of antifuses to implement a programmable logic device results in highly testable structures as well as an efficient programming architecture. The structure is highly testable because there are no preexisting connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed as well as isolate individual circuit structures to be tested. This can be done both before and after programming. For example, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Four types of antifuse connections are used in the routing structure of the ACT 3 array. (The physical structure of the antifuse is identical in each case; only the usage differs.)

Table 2-1 shows four types of antifuses.

***Table 2-1* • Antifuse Types**

Type	Description
XF	Horizontal-to-vertical connection
HF	Horizontal-to-horizontal connection
VF	Vertical-to-vertical connection
FF	"Fast" vertical connection

Examples of all four types of connections are shown in Figure 2-7 on page 2-6 and Figure 2-8 on page 2-6.

Module Interface

Connections to Logic and I/O modules are made through vertical segments that connect to the module inputs and outputs. These vertical segments lie on vertical tracks that span the entire height of the array.

Module Input Connections

The tracks dedicated to module inputs are segmented by pass transistors in each module row. During normal user operation, the pass transistors are inactive, which isolates the inputs of a module from the inputs of the module directly above or below it. During certain test modes, the pass transistors are active to verify the continuity of the metal tracks. Vertical input segments span only the channel above or the channel below. The logic modules are arranged such that half of the inputs are connected to the channel above and half of the inputs to segments in the channel below, as shown in Figure 2-9.

Timing Derating

ACT 3 devices are manufactured in a CMOS process. Therefore, device performance varies according to temperature, voltage, and process variations. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing.

Table 2-15 **• Timing Derating Factor (Temperature and Voltage)**

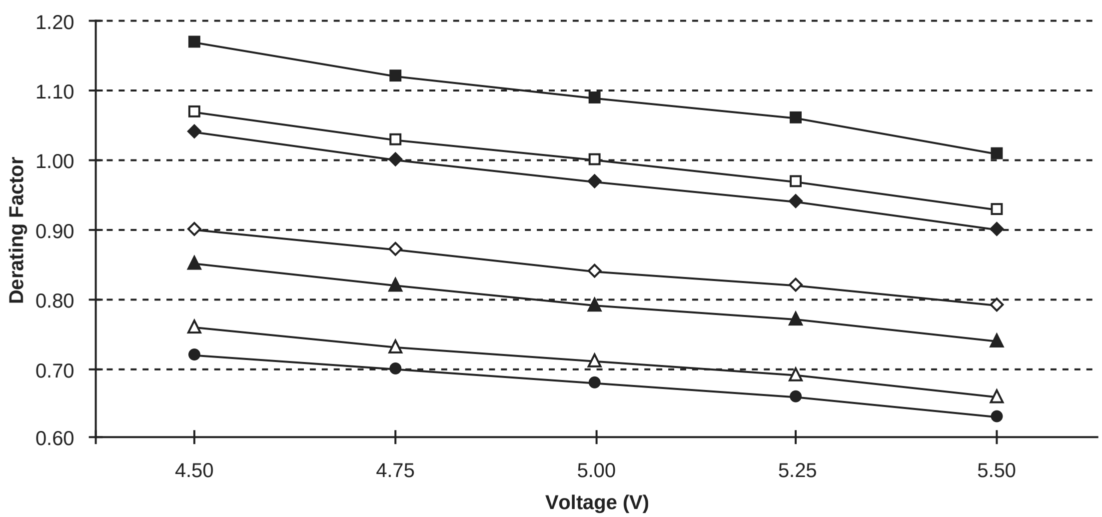
(Commercial Minimum/Maximum Specification) x	Industrial		Military	
	Min.	**Max.**	**Min.**	Max.
	0.66	1.07	0.63	1.17

Table 2-16 **• Timing Derating Factor for Designs at Typical Temperature (T_J = 25°C) and Voltage (5.0 V)**

(Commercial Maximum Specification) x	0.85

Table 2-17 **• Temperature and Voltage Derating Factors (normalized to Worst-Case Commercial, TJ = 4.75 V, 70°C)**

	–55	**–40**	**0**	**25**	**70**	**85**	**125**
4.50	0.72	0.76	0.85	0.90	1.04	1.07	1.117
4.75	0.70	0.73	0.82	0.87	1.00	1.03	1.12
5.00	0.68	0.71	0.79	0.84	0.97	1.00	1.09
5.25	0.66	0.69	0.77	0.82	0.94	0.97	1.06
5.50	0.63	0.66	0.74	0.79	0.90	0.93	1.01



Note: This derating factor applies to all routing and propagation delays.

Notes:

1. *VCC = 3.0 V for 3.3 V specifications.*
2. *For dual-module macros, use $t_{PD} + t_{RD1} + t_{PDn} + t_{CO} + t_{RD1} + t_{PDn}$ or $t_{PD1} + t_{RD1} + t_{SUD}$, whichever is appropriate.*
3. *The –2 and –3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at http://www.microsemi.com/soc/support/notifications/default.aspx#pdn.*
4. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

Pin Descriptions

CLKA Clock A (Input)

Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

CLKB Clock B (Input)

Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

GND Ground

LOW supply voltage.

HCLK Dedicated (Hard-wired) Array Clock (Input)

Clock input for sequential modules. This input is directly wired to each S-Module and offers clock speeds independent of the number of S-Modules being driven. This pin can also be used as an I/O.

I/O Input/Output (Input, Output)

The I/O pin functions as an input, output, three-state, or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/O pins are tristated by the Designer Series software.

IOCLK Dedicated (Hard-wired) I/O Clock (Input)

Clock input for I/O modules. This input is directly wired to each I/O module and offers clock speeds independent of the number of I/O modules being driven. This pin can also be used as an I/O.

IOPCL Dedicated (Hard-wired) I/O Preset/Clear (Input)

Input for I/O preset or clear. This global input is directly wired to the preset and clear inputs of all I/O registers. This pin functions as an I/O when no I/O preset or clear macros are used.

MODE Mode (Input)

The MODE pin controls the use of diagnostic pins (DCLK, PRA, PRB, SDI). When the MODE pin is HIGH, the special functions are active. When the MODE pin is LOW, the pins function as I/Os. To provide Actionprobe capability, the MODE pin should be terminated to GND through a 10K resistor so that the MODE pin can be pulled high when required.

NC No Connection

This pin is not connected to circuitry within the device.

PRA Probe A (Output)

The Probe A pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe B pin to allow real-time diagnostic output of any signal path within the device. The Probe A pin can be used as a user-defined I/O when debugging has been completed. The pin’s probe capabilities can be permanently disabled to protect programmed design confidentiality. PRA is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

PRB Probe B (Output)

The Probe B pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe A pin to allow real-time diagnostic output of any signal path within the device. The Probe B pin can be used as a user-defined I/O when debugging has been completed. The pin’s probe capabilities can be permanently disabled to protect programmed design confidentiality. PRB is accessible when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.

SDI Serial Data Input (Input)

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is HIGH. This pin functions as an I/O when the MODE pin is LOW.
