

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	848
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	167
Number of Gates	6000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1460a-pq208i

Ordering Information

Notes:

1. The -2 and -3 speed grades have been discontinued.
2. The Ceramic Pin Grid Array packages PG100, PG133, and PG175 have been discontinued in all device densities, speed grades, and temperature grades.
3. The Plastic Ball Grid Array package BG225 has been discontinued in all device densities (specifically for A1460A), all speed grades, and all temperature grades.
4. Military Grade devices are no longer available for the A1440A device.
5. For more information about discontinued devices, refer to the Product Discontinuation Notices (PDNs) listed below, available on the Microsemi SoC Products Group website:
PDN March 2001
PDN 0104
PDN 0203
PDN 0604

BG225	3-20
BG313	3-22
PG100	3-24
PG133	3-26
PG175	3-28
PG207	3-30
PG257	3-32

Datasheet Information

List of Changes	4-1
Datasheet Categories	4-3
Safety Critical, Life Support, and High-Reliability Applications Policy	4-3

Horizontal Routing

Horizontal channels are located between the rows of modules and are composed of several routing tracks. The horizontal routing tracks within the channel are divided into one or more segments. The minimum horizontal segment length is the width of a module-pair, and the maximum horizontal segment length is the full length of the channel. Any segment that spans more than one-third the row length is considered a long horizontal segment. A typical channel is shown in Figure 2-7. Undedicated horizontal routing tracks are used to route signal nets. Dedicated routing tracks are used for the global clock networks and for power and ground tie-off tracks.

Figure 2-7 • Horizontal Routing Tracks and Segments

Vertical Routing

Other tracks run vertically through the modules. Vertical tracks are of three types: input, output, and long. Vertical tracks are also divided into one or more segments. Each segment in an input track is dedicated to the input of a particular module. Each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing. Each output segment spans four channels (two above and two below), except near the top and bottom of the array where edge effects occur. LVTs contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 2-8.

Figure 2-8 • Vertical Routing Tracks and Segments

Power Dissipation

$$P = [ICC_{\text{standby}} + I_{\text{active}}] * VCC * IOL * VOL * N + IOH * (VCC - VOH) * M$$

EQ 3

where:

ICC standby is the current flowing when no inputs or outputs are changing

Iactive is the current flowing due to CMOS switching.

IOL and IOH are TTL sink/source current.

VOL and VOH are TTL level output voltages.

N is the number of outputs driving TTL loads to VOL.

M equals the number of outputs driving TTL loads to VOH.

An accurate determination of N and M is problematical because their values depend on the design and on the system I/O. The power can be divided into two components: static and active.

Static Power Component

Microsemi FPGAs have small static power components that result in lower power dissipation than PALs or PLDs. By integrating multiple PALs/PLDs into one FPGA, an even greater reduction in board-level power dissipation can be achieved.

The power due to standby current is typically a small component of the overall power. Standby power is calculated in Table 2-9 for commercial, worst case conditions.

Table 2-9 • Standby Power Calculation

ICC	VCC	Power
2 mA	5.25 V	10.5 mW

The static power dissipated by TTL loads depends on the number of outputs driving high or low and the DC load current. Again, this value is typically small. For instance, a 32-bit bus sinking 4 mA at 0.33 V will generate 42 mW with all outputs driving low, and 140 mW with all outputs driving high. The actual dissipation will average somewhere between as I/Os switch states with time.

Active Power Component

Power dissipation in CMOS devices is usually dominated by the active (dynamic) power dissipation. This component is frequency dependent, a function of the logic and the external I/O. Active power dissipation results from charging internal chip capacitances of the interconnect, unprogrammed antifuses, module inputs, and module outputs, plus external capacitance due to PC board traces and load device inputs.

An additional component of the active power dissipation is the totem-pole current in CMOS transistor pairs. The net effect can be associated with an equivalent capacitance that can be combined with frequency and voltage to represent active power dissipation.

Equivalent Capacitance

The power dissipated by a CMOS circuit can be expressed by EQ 4.

$$\text{Power } (\mu\text{W}) = C_{\text{EQ}} * VCC^2 * F$$

EQ 4

Where:

C_{EQ} is the equivalent capacitance expressed in pF.

VCC is the power supply in volts.

F is the switching frequency in MHz.

Notes:

1. VCC = 3.0 V for 3.3 V specifications.
2. For dual-module macros, use t_{PD} + t_{RD1} + t_{PDn} + t_{CO} + t_{RD1} + t_{PDn} or t_{PD1} + t_{RD1} + t_{SUD}, whichever is appropriate.
3. The –2 and –3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at <http://www.microsemi.com/soc/support/notifications/default.aspx#pdn>.
4. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

84	CLKB, I/O	CLKB, I/O	CLKB, I/O

Notes:

1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

Revision	Changes	Page
Revision 2 (continued)	In the "Package Pin Assignments" section, notes were added to the pin tables for the following packages, stating that they are discontinued: "BG225" "PG100" "PG133" "PG175"	3-20 3-24 3-26 3-28
Revision 1 (June 2006)	RoHS compliant information was added to the "Ordering Information" section.	II
