

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	848
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	131
Number of Gates	6000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1460a-pqg160c

Note: The -2 and -3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at <http://www.microsemi.com/soc/support/notifications/default.aspx#pdn>.

2 – Detailed Specifications

This section of the datasheet is meant to familiarize the user with the architecture of the ACT 3 family of FPGA devices. A generic description of the family will be presented first, followed by a detailed description of the logic blocks, the routing structure, the antifuses, and the special function circuits. The on-chip circuitry required to program the devices is not covered.

Topology

The ACT 3 family architecture is composed of six key elements: Logic modules, I/O modules, I/O Pad Drivers, Routing Tracks, Clock Networks, and Programming and Test Circuits. The basic structure is similar for all devices in the family, differing only in the number of rows, columns, and I/Os. The array itself consists of alternating rows of modules and channels. The logic modules and channels are in the center of the array; the I/O modules are located along the array periphery. A simplified floor plan is depicted in Figure 2-1.

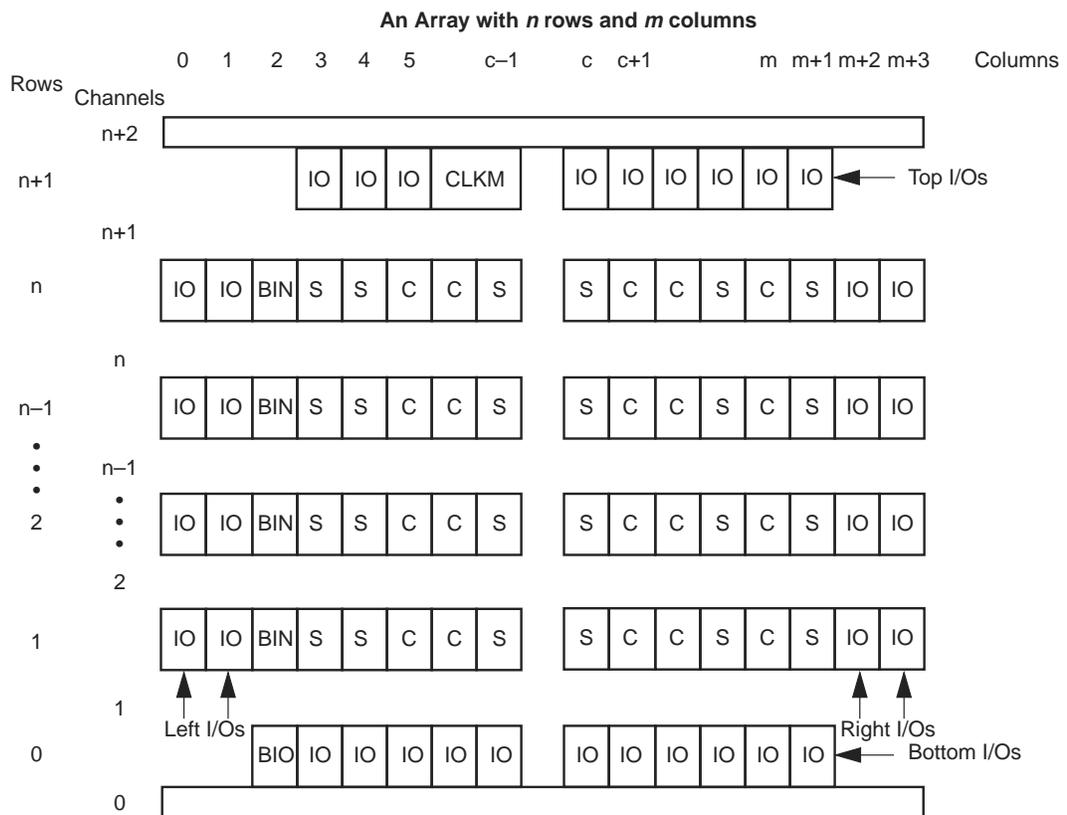

Figure 2-1 • Generalized Floor Plan of ACT 3 Device

Equivalent capacitance is calculated by measuring ICC active at a specified frequency and voltage for each circuit component of interest. Measurements have been made over a range of frequencies at a fixed value of VCC. Equivalent capacitance is frequency independent so that the results may be used over a wide range of operating conditions. Equivalent capacitance values are shown in Figure 2-10.

Table 2-10 • CEQ Values for Microsemi FPGAs

Item	CEQ Value
Modules (C_{EQM})	6.7
Input Buffers (C_{EQI})	7.2
Output Buffers (C_{EQO})	10.4
Routed Array Clock Buffer Loads (C_{EQCR})	1.6
Dedicated Clock Buffer Loads (C_{EQCD})	0.7
I/O Clock Buffer Loads (C_{EQCI})	0.9

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. EQ 5 shows a piece-wise linear summation over all components.

$$\begin{aligned}
 \text{Power} = & VCC^2 * [(m * C_{EQM} * f_m)_{\text{modules}} + (n * C_{EQI} * f_n)_{\text{inputs}} \\
 & + (p * (C_{EQO} + C_L) * f_p)_{\text{outputs}} \\
 & + 0.5 * (q1 * C_{EQCR} * f_{q1})_{\text{routed_Clk1}} + (r1 * f_{q1})_{\text{routed_Clk1}} \\
 & + 0.5 * (q2 * C_{EQCR} * f_{q2})_{\text{routed_Clk2}} \\
 & + (r2 * f_{q2})_{\text{routed_Clk2}} + 0.5 * (s1 * C_{EQCD} * f_{s1})_{\text{dedicated_Clk}} \\
 & + (s2 * C_{EQCI} * f_{s2})_{\text{IO_Clk}}]
 \end{aligned}$$

EQ 5

Where:

m = Number of logic modules switching at f_m

n = Number of input buffers switching at f_n

p = Number of output buffers switching at f_p

$q1$ = Number of clock loads on the first routed array clock

$q2$ = Number of clock loads on the second routed array clock

$r1$ = Fixed capacitance due to first routed array clock

$r2$ = Fixed capacitance due to second routed array clock

$s1$ = Fixed number of clock loads on the dedicated array clock

$s2$ = Fixed number of clock loads on the dedicated I/O clock

C_{EQM} = Equivalent capacitance of logic modules in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of routed array clock in pF

C_{EQCD} = Equivalent capacitance of dedicated array clock in pF

C_{EQCI} = Equivalent capacitance of dedicated I/O clock in pF

C_L = Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average first routed array clock rate in MHz

f_{q2} = Average second routed array clock rate in MHz

f_{s1} = Average dedicated array clock rate in MHz

f_{s2} = Average dedicated I/O clock rate in MHz

Determining Average Switching Frequency

To determine the switching frequency for a design, you must have a detailed understanding of the data input values to the circuit. The following guidelines are meant to represent worst-case scenarios so that they can be generally used to predict the upper limits of power dissipation. These guidelines are as follows:

Table 2-13 • Guidelines for Predicting Power Dissipation

Data	Value
Logic Modules (m)	80% of modules
Inputs switching (n)	# inputs/4
Outputs switching (p)	# output/4
First routed array clock loads (q1)	40% of sequential modules
Second routed array clock loads (q2)	40% of sequential modules
Load capacitance (CL)	35 pF
Average logic module switching rate (fm)	F/10
Average input switching rate (fn)	F/5
Average output switching rate (fp)	F/10
Average first routed array clock rate (fq1)	F/2
Average second routed array clock rate (fq2)	F/2
Average dedicated array clock rate (fs1)	F
Average dedicated I/O clock rate (fs2)	F

CQ132	
Pin Number	A1425 Function
1	NC
2	GND
3	SDI, I/O
9	MODE
10	GND
11	VCC
22	VCC
26	GND
27	VCC
34	NC
36	GND
42	GND
43	VCC
48	PRB, I/O
50	HCLK, I/O
58	GND
59	VCC
63	SDO
64	IOPCL, I/O
65	GND
66	NC

CQ132	
Pin Number	A1425 Function
67	NC
74	GND
75	VCC
78	VCC
89	VCC
90	GND
91	VCC
92	GND
98	IOCLK, I/O
99	NC
100	NC
101	GND
106	GND
107	VCC
116	CLKA, I/O
117	CLKB, I/O
118	PRA, I/O
122	GND
123	VCC
131	DCLK, I/O
132	NC

Notes:

1. All unlisted pin numbers are user I/Os.
2. NC denotes no connection.
3. MODE should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.
