
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	564
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	83
Number of Gates	4000
Voltage - Supply	3V ~ 3.6V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a14v40a-vq100c

Product Plan

Device/Package	Speed Grade[1]				Application[1]			
	Std.	–1	–2	–3	C	I	M	B

176-Pin Thin Quad Flatpack (TQFP)	✓	✓	D	D	✓	✓	–	–

Notes:

1. *Applications:*
   C = Commercial
   I = Industrial
   M = Military
2. *Commercial only*

Availability:
✓ = Available
P = Planned
– = Not planned
D = Discontinued

Speed Grade:
–1 = Approx. 15% faster than Std.
–2 = Approx. 25% faster than Std.
–3 = Approx. 35% faster than Std.
(–2 and –3 speed grades have been discontinued.)

***Table 1-1* • Chip-to-Chip Performance (worst-case commercial)**

Device and Speed Grade	t_{CKHS} (ns)	t_{TRACE} (ns)	t_{INSU} (ns)	Total (ns)	MHz
A1425A -3	7.5	1.0	1.8	10.3	97
A1460A -3	9.0	1.0	1.3	11.3	88
A1425A -2	7.5	1.0	2.0	10.5	95
A1460A -2	9.0	1.0	1.5	11.5	87
A1425A -1	9.0	1.0	2.3	12.3	81
A1460A -1	10.0	1.0	1.8	12.8	78
A1425A STD	10.0	1.0	2.7	13.7	73
A1460A STD	11.5	1.0	2.0	14.5	69

Note: The –2 and –3 speed grades have been discontinued. Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004 at http://www.microsemi.com/soc/support/notifications/default.aspx#pdn.

Logic Modules

ACT 3 logic modules are enhanced versions of the 1200XL family logic modules. As in the 1200XL family, there are two types of modules: C-modules and S-modules (Figure 2-2 and Figure 2-3). The C-module is functionally equivalent to the 1200XL C-module and implements high fanin combinatorial macros, such as 5-input AND, 5-input OR, and so on. It is available for use as the CM8 hard macro. The S-module is designed to implement high-speed sequential functions within a single module.

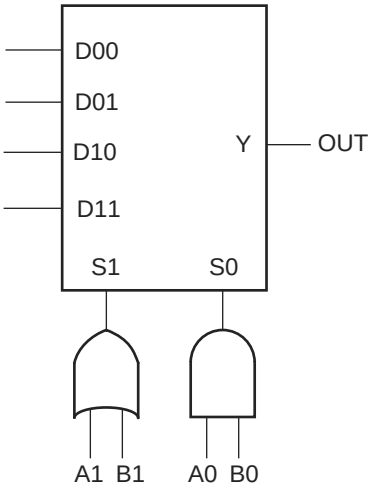

Figure 2-2 • **C-Module Diagram**

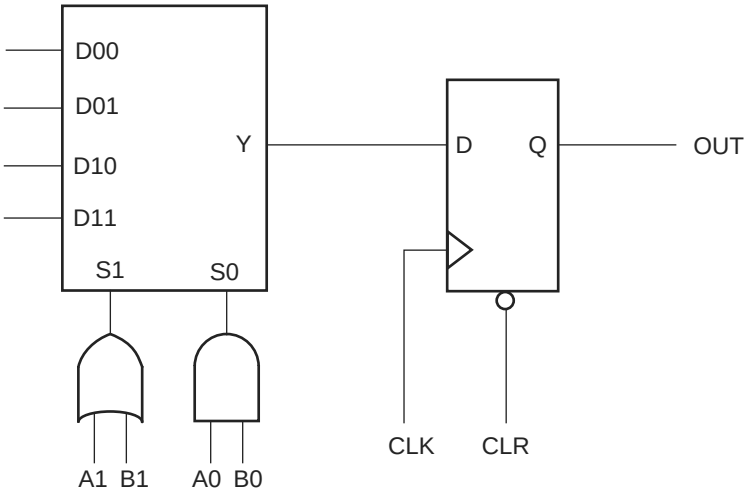

Figure 2-3 • **S-Module Diagram**

S-modules consist of a full C-module driving a flip-flop, which allows an additional level of logic to be implemented without additional propagation delay. It is available for use as the DFM8A/B and DLM8A/B hard macros. C-modules and S-modules are arranged in pairs called module-pairs. Module-pairs are arranged in alternating patterns and make up the bulk of the array. This arrangement allows the placement software to support two-module macros of four types (CC, CS, SC, and SS). The C-module implements the following function:

Y = !S1 * !S0 * D00 + !S1 * S0 * D01 + S1 * !S0 * D10 + S1 * S0 * D11

EQ 1

where: S0 = A0 * B0 and S1 = A1 + B1

Horizontal Routing

Horizontal channels are located between the rows of modules and are composed of several routing tracks. The horizontal routing tracks within the channel are divided into one or more segments. The minimum horizontal segment length is the width of a module-pair, and the maximum horizontal segment length is the full length of the channel. Any segment that spans more than one-third the row length is considered a long horizontal segment. A typical channel is shown in Figure 2-7. Undedicated horizontal routing tracks are used to route signal nets. Dedicated routing tracks are used for the global clock networks and for power and ground tie-off tracks.

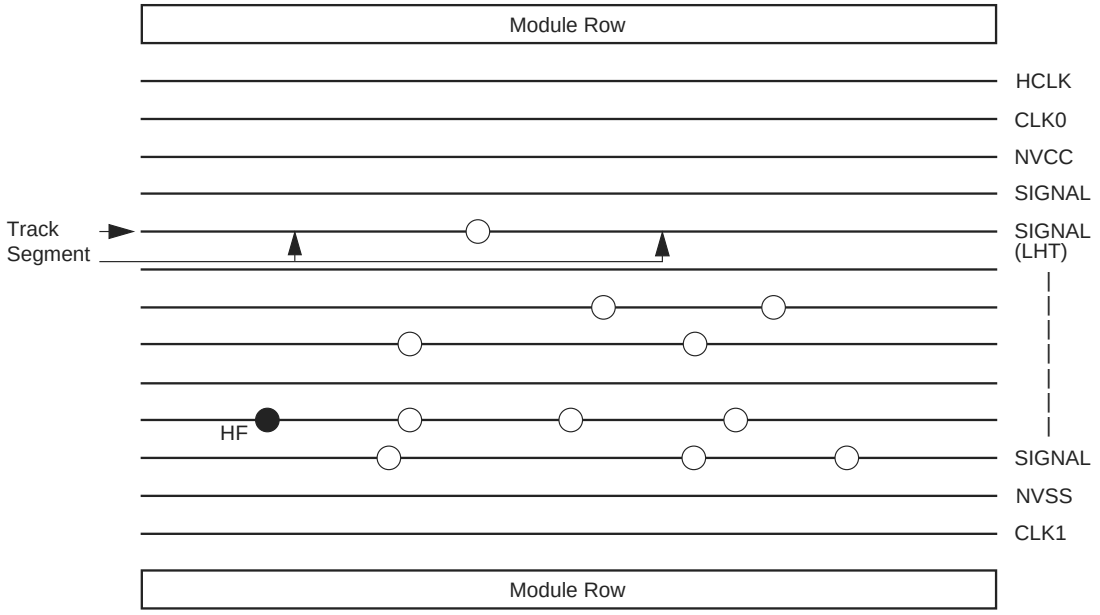

Figure 2-7 • **Horizontal Routing Tracks and Segments**

Vertical Routing

Other tracks run vertically through the modules. Vertical tracks are of three types: input, output, and long. Vertical tracks are also divided into one or more segments. Each segment in an input track is dedicated to the input of a particular module. Each segment in an output track is dedicated to the output of a particular module. Long segments are uncommitted and can be assigned during routing. Each output segment spans four channels (two above and two below), except near the top and bottom of the array where edge effects occur. LVTs contain either one or two segments. An example of vertical routing tracks and segments is shown in Figure 2-8.

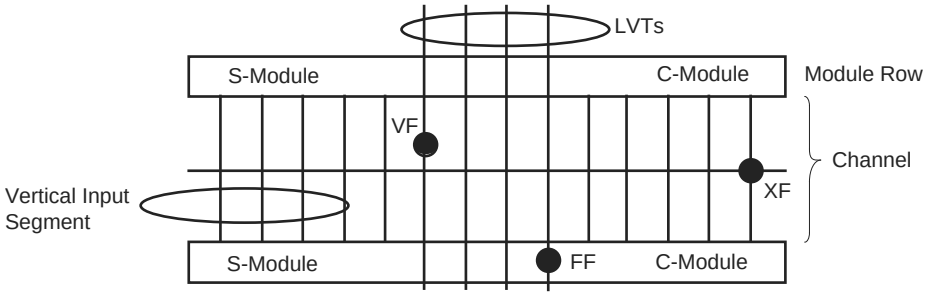

Figure 2-8 • **Vertical Routing Tracks and Segments**

Antifuse Connections

An antifuse is a “normally open” structure as opposed to the normally closed fuse structure used in PROMs or PALs. The use of antifuses to implement a programmable logic device results in highly testable structures as well as an efficient programming architecture. The structure is highly testable because there are no preexisting connections; temporary connections can be made using pass transistors. These temporary connections can isolate individual antifuses to be programmed as well as isolate individual circuit structures to be tested. This can be done both before and after programming. For example, all metal tracks can be tested for continuity and shorts between adjacent tracks, and the functionality of all logic modules can be verified.

Four types of antifuse connections are used in the routing structure of the ACT 3 array. (The physical structure of the antifuse is identical in each case; only the usage differs.)

Table 2-1 shows four types of antifuses.

Table 2-1 • **Antifuse Types**

Type	Description
XF	Horizontal-to-vertical connection
HF	Horizontal-to-horizontal connection
VF	Vertical-to-vertical connection
FF	"Fast" vertical connection

Examples of all four types of connections are shown in Figure 2-7 on page 2-6 and Figure 2-8 on page 2-6.

Module Interface

Connections to Logic and I/O modules are made through vertical segments that connect to the module inputs and outputs. These vertical segments lie on vertical tracks that span the entire height of the array.

Module Input Connections

The tracks dedicated to module inputs are segmented by pass transistors in each module row. During normal user operation, the pass transistors are inactive, which isolates the inputs of a module from the inputs of the module directly above or below it. During certain test modes, the pass transistors are active to verify the continuity of the metal tracks. Vertical input segments span only the channel above or the channel below. The logic modules are arranged such that half of the inputs are connected to the channel above and half of the inputs to segments in the channel below, as shown in Figure 2-9.

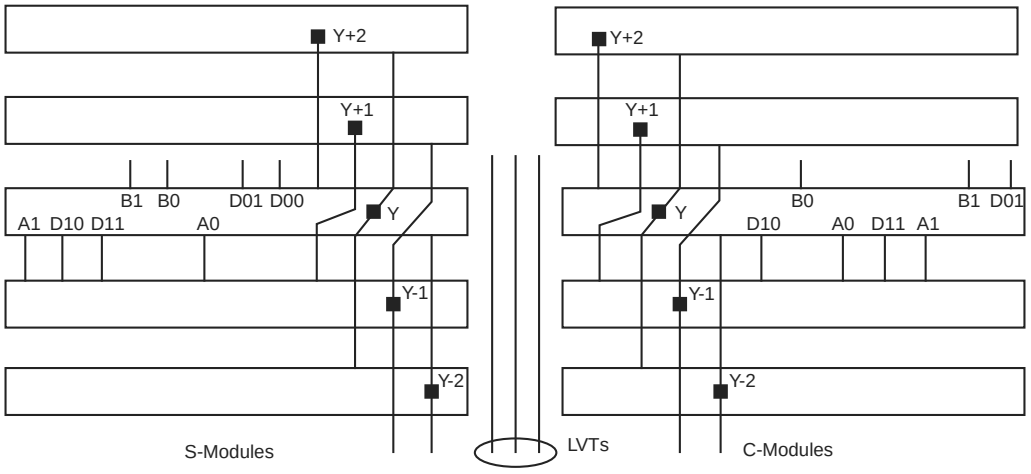

Figure 2-9 • **Logic Module Routing Interface**

5 V Operating Conditions

Table 2-2 • **Absolute Maximum Ratings[1], Free Air Temperature Range**

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	–0.5 to +7.0	V
VI	Input voltage	–0.5 to VCC + 0.5	V
VO	Output voltage	–0.5 to VCC + 0.5	V
IIO	I/O source sink current[2]	±20	mA
T_{STG}	Storage temperature	–65 to +150	°C

Notes:

1. *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.*
2. *Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND –0.5 V, the internal protection diodes will forward bias and can draw excessive current.*

Table 2-3 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature range*	0 to +70	–40 to +85	–55 to +125	°C
5 V power supply tolerance	±5	±10	±10	%VCC

*Note: *Ambient temperature (T_A) is used for commercial and industrial; case temperature (T_C) is used for military.*

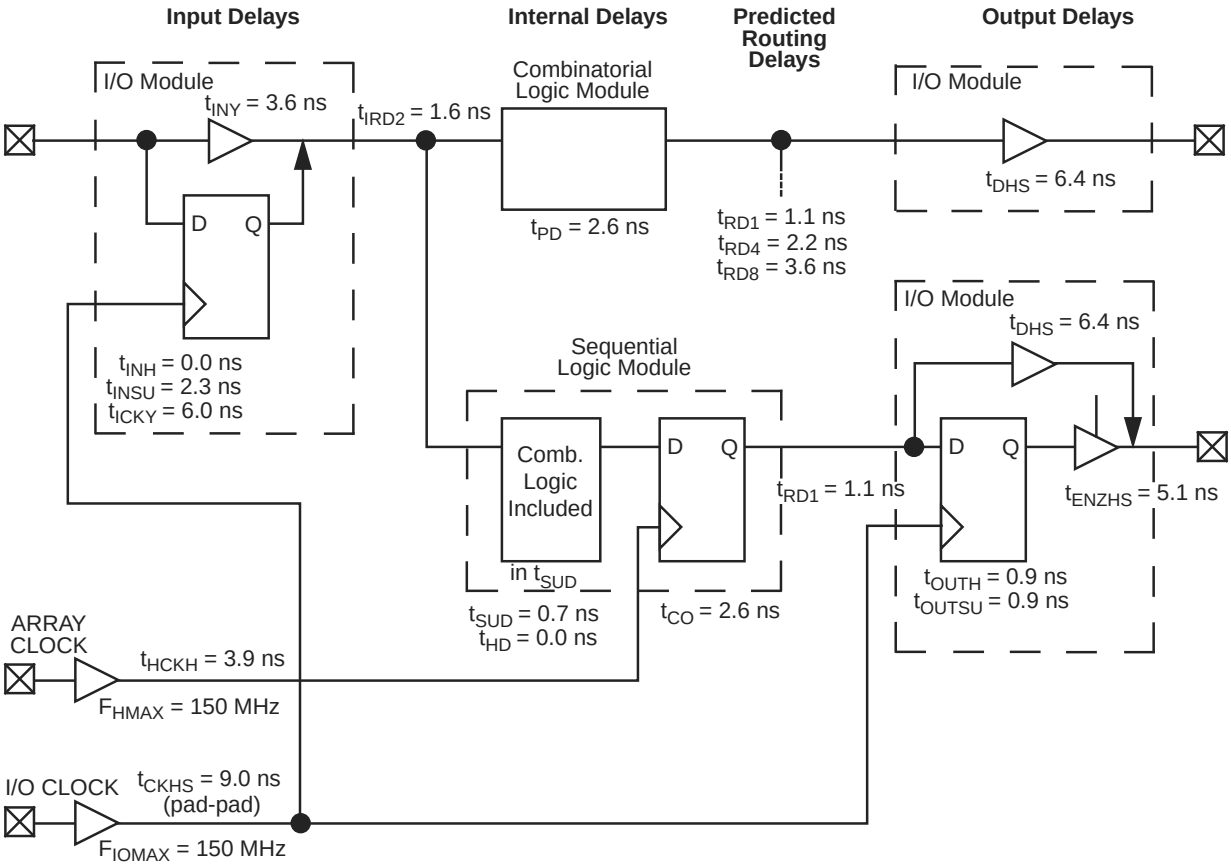
Table 2-4 • **Electrical Specifications**

			Commercial		Industrial		Military		
Symbol	Parameter	Test Condition	Min.	Max.	Min.	Max.	Min.	Max.	Units
VOH[1,2]	High level output	IOH = –4 mA (CMOS)	–	–	3.7	–	3.7	–	V
		IOH = –6 mA (CMOS)	3.84						V
		IOH = –10 mA (TTL)[3]	2.40						V
VOL[1,2]	Low level output	IOL = +6 mA (CMOS)		0.33		0.4		0.4	V
		IOL = +12 mA (TTL)[3]		0.50					
VIH	High level input	TTL inputs	2.0	VCC + 0.3	2.0	VCC + 0.3	2.0	VCC + 0.3	V
VIL	Low level input	TTL inputs	–0.3	0.8	–0.3	0.8	–0.3	0.8	V
IIN	Input leakage	VI = VCC or GND	–10	+10	–10	+10	–10	+10	µA
IOZ	3-state output leakage	VO = VCC or GND	–10	+10	–10	+10	–10	+10	µA
C_{IO}	I/O capacitance[3,4]			10		10		10	pF
ICC(S)	Standby VCC supply current (typical = 0.7 mA)			2		10		20	mA
ICC(D)	Dynamic VCC supply current. See the Power Dissipation section.								

Notes:

1. *Microsemi devices can drive and receive either CMOS or TTL signal levels. No assignment of I/Os as TTL or CMOS is required.*
2. *Tested one output at a time, VCC = minimum.*
3. *Not tested; for information only.*
4. *VOUT = 0 V, f = 1 MHz*
5. *Typical standby current = 0.7 mA. All outputs unloaded. All inputs = VCC or GND.*

ACT 3 Timing Model



Note: Values shown for A1425A –1 speed grade device.

4 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the datasheet.

Revision	Changes	Page
Revision 3 (January 2012)	The description for SDO pins had earlier been removed from the datasheet and has now been included again, in the "Pin Descriptions" section (SAR 35820).	2-21
	SDO pin numbers had earlier been removed from package pin assignment tables in the datasheet, and have now been restored to the pin tables (SAR 35820).	3-1
Revision 2 (September 2011)	The ACT 3 datasheet was formatted newly in the style used for current datasheets. The same information is present (other than noted in the list of changes for this revision) but divided into chapters.	N/A
	The datasheet was revised to note in multiple places that speed grades –2 and –3 have been discontinued. The following device/package combinations have been discontinued for all speed grades and temperatures (SAR 33872): A1415 PG100 A1425 PG133 A1440 PG175 A1460 BG225 Refer to PDN 0104, PDN 0203, PDN 0604, and PDN 1004.	I and others
	The "Features" section was revised to state the clock-to-ouput time and on-chip performance for –1 speed grade as 9.0 ns and 186 MHz. The "General Description" section was revised in accordance (SAR 33872).	I
	The maximum performance values were updated in Table 1 • ACT 3 Family Product Information, and now reflect worst-case commercial for the –1 speed grade (SAR 33872).	I
	The "Product Plan" table was updated as follows to conform to current offerings (SAR 33872): The A1415A device is offered in PL84, PG100, and VQ100 packages for Military application. The A1440A device is offered in TQ176 and VQ100 packages for Industrial application.	III
	Table 1-1 • Chip-to-Chip Performance (worst-case commercial) was updated to include data for all speed grades instead of only –3 (SAR 33872).	1-2
	Figure 1-1 • Predictable Performance (worst-case commercial, –1 speed grade) was revised to reflect values for the –1 speed grade (SAR 33872).	1-1
	Figure 2-10 • Timing Model was updated to show data for the –1 speed grade instead of –3 (SAR 33872).	2-16
	Table 2-14 • Logic Module and Routing Delay by Fanout (ns); Worst-Case Commercial Conditions was updated to include data for all speed grades instead of only –3 (SAR 33872).	2-20
	Package names used in the "Package Pin Assignments" section and throughout the document were revised to match standards given in *Package Mechanical Drawings* (SAR 27395).	3-1
