### Understanding [Embedded - CPLDs \(Complex Programmable Logic Devices\)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

### Description

The XC9536XV is a 2.5V CPLD targeted for high-performance, low-voltage applications in leading-edge communications and computing systems. It is comprised of two 54V18 Function Blocks, providing 800 usable gates with propagation delays of 5 ns. See [XC9536XL](#) for architecture overview.

### Power Estimation

Power dissipation in CPLDs can vary substantially depending on the system frequency, design application and output loading. To help reduce power dissipation, each macrocell in a XC9500XV device may be configured for low-power mode (from the default high-performance mode). In addition, unused product-terms and macrocells are automatically deactivated by the software to further conserve power. For a general estimate of  $I_{CC}$ , the following equation may be used:

$$P_{TOTAL} = P_{INT} + P_{IO} = I_{CCINT} \times V_{CCINT} + P_{IO}$$

Separating internal and I/O power here is convenient because XC9500XV CPLDs also separate the corresponding power pins.  $P_{IO}$  is a strong function of the load capacitance driven, so it is handled by  $I = CVf$ .  $I_{CCINT}$  is another situation that reflects the actual design considered and the internal switching speeds. An estimation expression for  $I_{CCINT}$  (taken from simulation) is:

$$I_{CCINT}(mA) = MC_{HS}(0.122 \times PT_{HS} + 0.238) + MC_{LP}(0.042 \times PT_{LP} + 0.171) + 0.04(MC_{HS} + MC_{LP}) \times f_{MAX} \times MC_{TOG}$$

where:

$MC_{HS}$  = # macrocells used in high speed mode

$MC_{LP}$  = #macrocells used in low power mode

$PT_{HS}$  = average p-terms used per high speed macrocell

$PT_{LP}$  = average p-terms used over low power macrocell

$f_{MAX}$  = max clocking frequency in the device

$MC_{TOG}$  = % macrocells toggling on each clock (12% is frequently a good estimate)

This calculation was derived from laboratory measurements of an XC9500XV part filled with 16-bit counters and allowing a single output (the LSB) to be enabled. The actual  $I_{CC}$  value varies with the design application and should be verified during normal system operation. [Figure 1](#) shows the above estimation in a graphical form. For a more detailed discussion of power consumption in this device, see Xilinx

## Supported I/O Standards

Table 1: IOSTANDARD Options

IOSTANDARD	V <sub>CCIO</sub>
LVTTL	3.3V
LVC MOS2	2.5V
X25TO18	1.8V

The XC9536XV CPLD features both LVC MOS and LVTTL I/O implementations. See [Table 1](#) for I/O standard voltages.

The LVTTL I/O standard is a general purpose EIA/JEDEC standard for 3.3V applications that use an LVTTL input buffer and Push-Pull output buffer. The LVC MOS2 standard is used in 2.5V applications.

XC9500XV CPLDs are also 1.8V I/O compatible. The X25TO18 setting is provided for generating 1.8V compatible outputs from a CPLD normally operating in a 2.5V environment. The default I/O Standard for pads without IOSTANDARD attributes is LVTTL for XC9500XV devices.

## Absolute Maximum Ratings

### Notes:

- Maximum DC undershoot below GND must be limited to either 0.5V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to –2.0V or overshoot to +3.6V, provided this over- or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.
- Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.
- For solder specifications, see [Xilinx Packaging](#).

### Notes:

- Due to the small size of chip scale packages, part marking on these packages does not follow the above sample and the complete part number cannot be included in the marking. Part marking on chip scale packages by line:
  - Line 1 = X (Xilinx logo), then truncated part number (no XC), i.e., 95xxxXV.
  - Line 2 = Not related to device part number.
  - Line 3 = Not related to device part number.
  - Line 4 = Package code, speed, operating temperature, three digits not related to device part number. Package code: C1 = CS48.
