
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	32MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LCD, POR, PWM, WDT
Number of I/O	43
Program Memory Size	14KB (8K x 14)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 39x12b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	48-UFQFN Exposed Pad
Supplier Device Package	48-UQFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f19185-e-mv

bit 7-2 **Unimplemented:** Read as '0'.

bit 1 **MEMV:** Memory Violation Flag bit
1 = No Memory Violation Reset occurred or set to '1' by firmware
0 = A Memory Violation Reset occurred (set '0' in hardware when a Memory Violation occurs)

bit 0 **VBATBOR:** VBAT Brown-Out Reset Status Bit
1 = No VBAT Brown-out Reset occurred.
0 = A VBAT Brown-out Reset occurred.

8.17 VBAT System

The VBAT subsystem allows the RTCC and SOSC to run from a battery connected to the VBAT pin in the event of a VDD failure. Typically, the battery is a 3V coin cell, however the system is designed to operate over the entire VDD voltage range. If VDD is greater than VBAT, the RTCC and SOSC will be powered by VDD. If VDD is less than VBAT, the RTCC and SOSC will switch over to VBAT. See Table 4-5 and Table 4-8 for more information on the VBAT registers.

Note: It should be noted that in this second scenario, VDD may still be in the valid operating range, but anytime the VDD drops below VBAT, the RTCC and SOSC will switch over to VBAT. This means that in a system with a 3V battery and a 2.8V VDD, the RTCC and SOSC will run off VBAT even when VDD is present.

8.17.1 VBAT GPR SEMAPHORE REGISTERS

The VBAT voltage domain offers the user four registers: VB0GPR, VB1GPR, VB3GPR and VB4GPR. These registers can be used by firmware to write any information that needs to survive a VDD failure. As long as either VDD or VBAT is valid, these registers will hold the last value written.

13.4.8 WRITE VERIFY

It is considered good programming practice to verify that program memory writes agree with the intended value. Since program memory is stored as a full row then the stored program memory contents are compared with the intended data stored in RAM after the last write is complete.

FIGURE 13-7: FLASH PROGRAM MEMORY VERIFY FLOWCHART

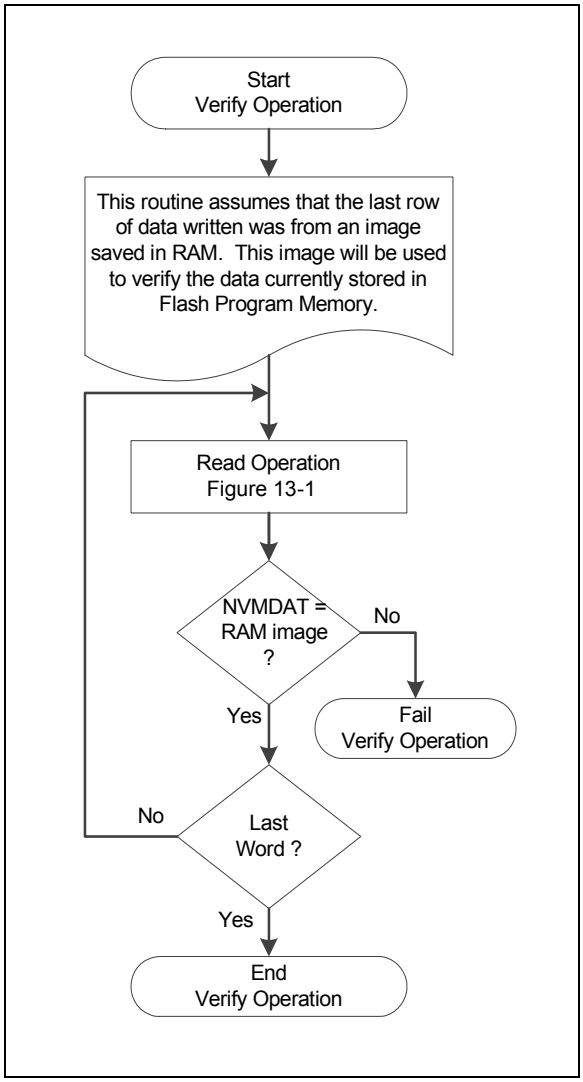

TABLE 19-1: ADC CLOCK PERIOD (TAD) VS. DEVICE OPERATING FREQUENCIES(1,4)

ADC Clock Period (TAD)		Device Frequency (FOSC)					
ADC Clock Source	CS<5:0>	32 MHz	20 MHz	16 MHz	8 MHz	4 MHz	1 MHz
FOSC/2	000000	62.5 ns(2)	100 ns(2)	125 ns(2)	250 ns(2)	500 ns	2.0 μs
FOSC/4	000001	125 ns(2)	200 ns(2)	250 ns(2)	500 ns	1.0 μs	4.0 μs
FOSC/6	000010	187.5 ns(2)	300 ns(2)	375 ns(2)	750 ns	1.5 μs	6.0 μs
FOSC/8	000011	250 ns(2)	400 ns(2)	500 ns	1.0 μs	2.0 μs	8.0 μs
...	...	...	...	...	...	...	...

...	...	...	...	...	...	...	...
FOSC/128	111111	4.0 μs	6.4 μs	8.0 μs	16.0 μs(3)	32.0 μs(2)	128.0 μs(2)
FRC	CS(ADCON0<4>) = 1	1.0-6.0 μs	1.0-6.0 μs	1.0-6.0 μs	1.0-6.0 μs	1.0-6.0 μs	1.0-6.0 μs

Legend: Shaded cells are outside of recommended range.

Note 1: See TAD parameter for FRC source typical TAD value.

2: These values violate the required TAD time.

3: Outside the recommended TAD time.

4: The ADC clock period (TAD) and total ADC conversion time can be minimized when the ADC clock is derived from the system clock FOSC. However, the FRC oscillator source must be used when conversions are to be performed with the device in Sleep mode.

27.6 Timer2/4 Operation During Sleep

When PSYNC = 1, Timer2/4 cannot be operated while the processor is in Sleep mode. The contents of the TMR2 and T2PR registers will remain unchanged while processor is in Sleep mode.

When PSYNC = 0, Timer2/4 will operate in Sleep as long as the clock source selected is also still running. Selecting the LFINTOSC, MFINTOSC, or HFINTOSC oscillator as the timer clock source will keep the selected oscillator running during Sleep.

bit 7-0 **SMTxCPR<23:16>**: Significant bits of the SMT Period Latch – Upper Byte

29.1.2 TIMER1 MODE RESOURCE

Timer1 must be running in Timer mode or Synchronized Counter mode for the CCP module to use the capture feature. In Asynchronous Counter mode, the capture operation may not work.

See **Section 26.0 "Timer1 Module with Gate Control"** for more information on configuring Timer1.

29.1.3 SOFTWARE INTERRUPT MODE

When the Capture mode is changed, a false capture interrupt may be generated. The user should keep the CCPxIE interrupt enable bit of the PIE6 register clear to avoid false interrupts. Additionally, the user should clear the CCPxIF interrupt flag bit of the PIR6 register following any change in Operating mode.

Note:	Clocking Timer1 from the system clock (FOSC) should not be used in Capture mode. In order for Capture mode to recognize the trigger event on the CCPx pin, Timer1 must be clocked from the instruction clock (FOSC/4) or from an external clock source.

29.1.4 CCP PRESCALER

There are four prescaler settings specified by the CCPxMODE<3:0> bits of the CCPxCON register. Whenever the CCP module is turned off, or the CCP module is not in Capture mode, the prescaler counter is cleared. Any Reset will clear the prescaler counter.

Switching from one capture prescaler to another does not clear the prescaler and may generate a false interrupt. To avoid this unexpected operation, turn the module off by clearing the CCPxCON register before changing the prescaler. Example 29-1 demonstrates the code to perform this function.

EXAMPLE 29-1: CHANGING BETWEEN CAPTURE PRESCALERS

```
BANKSEL CCPxCON     ;Set Bank bits to point
                    ;to CCPxCON
CLRF    CCPxCON     ;Turn CCP module off
MOVLW   NEW_CAPT_PS ;Load the W reg with
                    ;the new prescaler
                    ;move value and CCP ON
MOVWF   CCPxCON     ;Load CCPxCON with this
                    ;value
```

29.1.5 CAPTURE DURING SLEEP

Capture mode depends upon the Timer1 module for proper operation. There are two options for driving the Timer1 module in Capture mode. It can be driven by the instruction clock (FOSC/4), or by an external clock source.

When Timer1 is clocked by FOSC/4, Timer1 will not increment during Sleep. When the device wakes from Sleep, Timer1 will continue from its previous state.

Capture mode will operate during Sleep when Timer1 is clocked by an external clock source.

29.2 Compare Mode

Compare mode makes use of the 16-bit Timer1 resource. The 16-bit value of the CCPRxH:CCPRxL register pair is constantly compared against the 16-bit value of the TMR1H:TMR1L register pair. When a match occurs, one of the following events can occur:

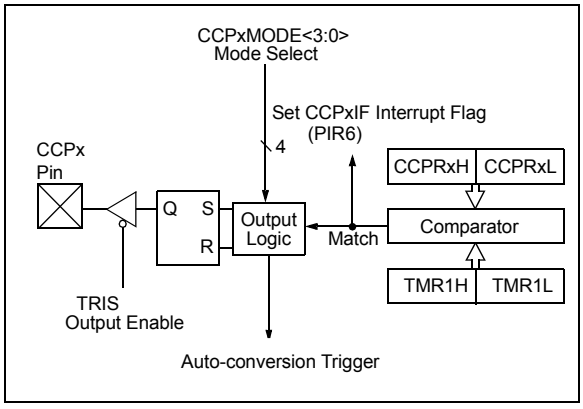
- Toggle the CCPx output
- Set the CCPx output
- Clear the CCPx output
- Generate an Auto-conversion Trigger
- Generate a Software Interrupt

The action on the pin is based on the value of the CCPxMODE<3:0> control bits of the CCPxCON register. At the same time, the interrupt flag CCPxIF bit is set, and an ADC conversion can be triggered, if selected.

All Compare modes can generate an interrupt and trigger and ADC conversion.

Figure 29-2 shows a simplified diagram of the compare operation.

FIGURE 29-2: COMPARE MODE OPERATION BLOCK DIAGRAM



30.1 Standard PWM Mode

The standard PWM mode generates a Pulse-Width Modulation (PWM) signal on the PWMx pin with up to ten bits of resolution. The period, duty cycle, and resolution are controlled by the following registers:

- TMR2 register
- PR2 register
- PWMxCON registers
- PWMxDCH registers
- PWMxDCL registers

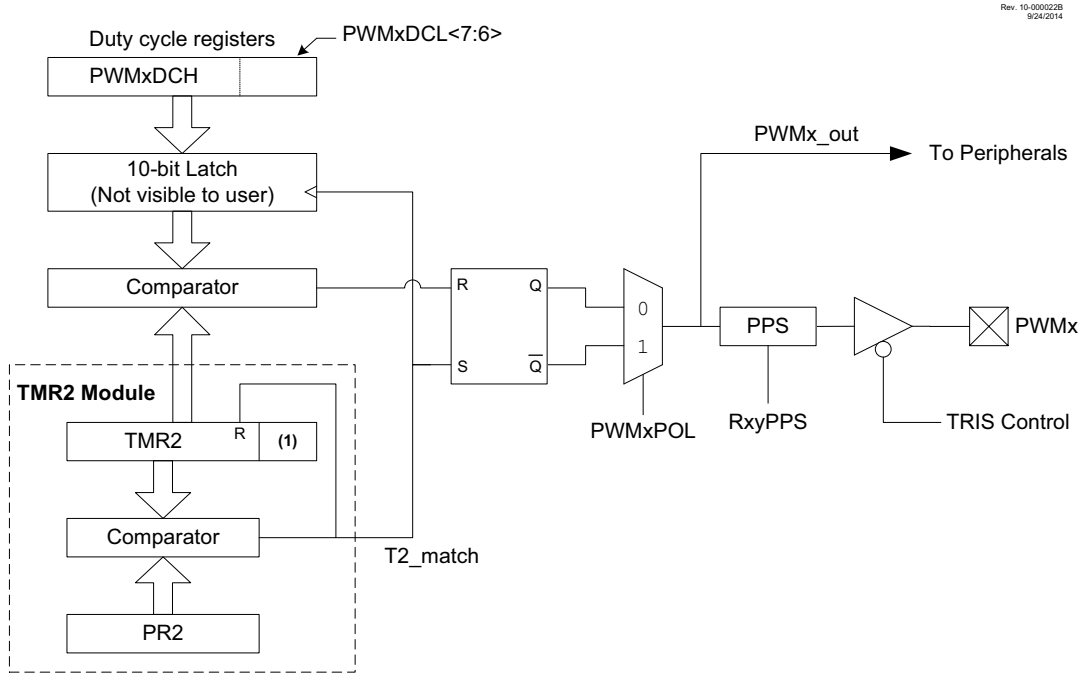
Figure 30-2 shows a simplified block diagram of PWM operation.

If PWMPOL = 0, the default state of the output is '0'. If PWMPOL = 1, the default state is '1'. If PWMEN = 0, the output will be the default state.

Note 1: The corresponding TRIS bit must be cleared to enable the PWM output on the PWMx pin.

2: Two identical Timer2 modules are implemented on this device. The timers are named Timer2 and Timer4. All references to Timer2 apply as well to Timer4. All references to T2PR apply as well to T4PR.

FIGURE 30-2: SIMPLIFIED PWM BLOCK DIAGRAM



Note 1: 8-bit timer is concatenated with two bits generated by Fosc or two bits of the internal prescaler to create 10-bit time-base.

0 = CLCIN0 (inverted) is not gated into CLCx Gate 1

33.6.5 I²C MASTER MODE REPEATED START CONDITION TIMING

A Repeated Start condition (Figure 33-27) occurs when the RSEN bit of the SSPxCON2 register is programmed high and the master state machine is no longer active. When the RSEN bit is set, the SCL pin is asserted low. When the SCL pin is sampled low, the Baud Rate Generator is loaded and begins counting. The SDA pin is released (brought high) for one Baud Rate Generator count (TBRG). When the Baud Rate Generator times out, if SDA is sampled high, the SCL pin will be deasserted (brought high). When SCL is sampled high, the Baud Rate Generator is reloaded and begins counting. SDA and SCL must be sampled high for one TBRG. This action is then followed by assertion of the SDA pin (SDA = 0) for one TBRG while SCL is high. SCL is asserted low. Following this, the RSEN bit of the SSPxCON2 register will be automatically cleared and the Baud Rate Generator will not be reloaded, leaving the SDA pin held low. As soon as a Start condition is detected on the SDA and SCL pins, the S bit of the SSPxSTAT register will be set. The SSPxIF bit will not be set until the Baud Rate Generator has timed out.

Note 1: If RSEN is programmed while any other event is in progress, it will not take effect.

2: A bus collision during the Repeated Start condition occurs if:

- SDA is sampled low when SCL goes from low-to-high.
- SCL goes low before SDA is asserted low. This may indicate that another master is attempting to transmit a data '1'.

TABLE 34-2: SUMMARY OF REGISTERS ASSOCIATED WITH EUSART

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on Page
INTCON	GIE	PEIE	—	—	—	—	—	INTEDG	164
PIR3	RC2IF	TX2IF	RC1IF	TX1IF	—	—	BCL1IF	SSP1IF	177
PIE3	RC2IE	TX2IE	RC1IE	TX1IE	—	—	BCL1IE	SSP1IE	168
RCxSTA	SPEN	RX9	SREN	CREN	ADDEN	FERR	OERR	RX9D	583
TXxSTA	CSRC	TX9	TXEN	SYNC	SENDB	BRGH	TRMT	TX9D	582
BAUDxCON	ABDOVF	RCIDL	—	SCKP	BRG16	—	WUE	ABDEN	584
RCxREG	RCxREG<7:0>								585*
TXxREG	TXxREG<7:0>								585*
SPxBRGL	SPxBRG<7:0>								585*
SPxBRGH	SPxBRG<15:8>								586*
RXPPS	—	—	—	RXPPS<4:0>					264
CKPPS	—	—	—	CXPPS<4:0>					264
RxyPPS	—	—	—	RxyPPS<4:0>					265
CLCxSELy	—	—	—	LCxDyS<4:0>					503

Legend: — = unimplemented location, read as '0'. Shaded cells are not used for the EUSART module.

* Page with register information.

TABLE 38-1: REGISTER FILE SUMMARY FOR PIC16(L)F19155/56/75/76/85/86 DEVICES

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on page
1E95h	—	Unimplemented								
1E96h	—	Unimplemented								
1E97h	—	Unimplemented								
1E98h	—	Unimplemented								
1E99h	—	Unimplemented								
1E9Ah	—	Unimplemented								
1E9Bh	—	Unimplemented								
1E9Ch	T2AINPPS	—	—	—	T2INPPS<4:0>					264

1E9Eh	—	Unimplemented								
1E9Fh	—	Unimplemented								
1EA0h	—	Unimplemented								
1EA1h	CCP1PPS	—	—	—	CCP1PPS<4:0>					264
1EA2h	CCP2PPS	—	—	—	CCP2PPS<4:0>					264
1EA3h	—	Unimplemented								
1EA4h	—	Unimplemented								
1EA5h	—	Unimplemented								
1EA6h	—	Unimplemented								
1EA7h	—	Unimplemented								
1EA8h	—	Unimplemented								
1EA9h	SMT1WINPPS	—	—	—	SMT1WINPPS<4:0>					264
1EAAh	SMT1SIGPPS	—	—	—	SMT1SIGPPS<4:0>					264
1EABh	—	Unimplemented								
1EACh	—	Unimplemented								
1EADh	—	Unimplemented								
1EAEh	—	Unimplemented								
1EAFh	—	Unimplemented								
1EB0h	—	Unimplemented								
1EB1h	CWG1PPS	—	—	—	CWG1PPS<4:0>					264
1EB2h	—	Unimplemented								
1EB3h	—	Unimplemented								
1EB4h	—	Unimplemented								
1EB5h	—	Unimplemented								
1EB6h	—	Unimplemented								
1EB7h	—	Unimplemented								
1EB8h	—	Unimplemented								
1EB9h	—	Unimplemented								
1EBAh	—	Unimplemented								
1EBBh	CLCIN0PPS	—	—	—	CLCIN0PPS<4:0>					264
1EBCh	CLCIN1PPS	—	—	—	CLCIN1PPS<4:0>					264
1EBDh	CLCIN2PPS	—	—	—	CLCIN2PPS<4:0>					264

Legend: x = unknown, u = unchanged, q = depends on condition, - = unimplemented, read as '0', r = reserved. Shaded locations unimplemented, read as '0'.

Note 1: Unimplemented data memory locations, read as '0'.
