
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	32MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LCD, POR, PWM, WDT
Number of I/O	43
Program Memory Size	28KB (16K x 14)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 39x12b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	48-UFQFN Exposed Pad
Supplier Device Package	48-UQFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic16f19186-i-mv

REGISTER 5-4: CONFIGURATION WORD 4: MEMORY

R/W-1	U-1	R/W-1	R/W-1	R/W-1	R/W-1
LVP	—	$\overline{\text{WRTSAF}}$(1)	$\overline{\text{WRTD}}$(1)	$\overline{\text{WRTC}}$(1)	$\overline{\text{WRTB}}$(1)
bit 13	12	11	10	9	bit 8

R/W-1	U-1	U-1	R/W-1	R/W-1	R/W-1	R/W-1	R/W-1
$\overline{\text{WRTAPP}}$(1)	—	—	$\overline{\text{SAFEN}}$(1)	$\overline{\text{BBEN}}$(1)	BBSIZE2	BBSIZE1	BBSIZE0
bit 7	6	5	4	3	2	1	bit 0

Legend:			
R = Readable bit	P = Programmable bit	x = Bit is unknown	U = Unimplemented bit, read as '1'
'0' = Bit is cleared	'1' = Bit is set	W = Writable bit	n = Value when blank or after Bulk Erase

bit 13 **LVP:** Low Voltage Programming Enable bit
1 = Low voltage programming enabled. $\overline{\text{MCLR}}$/VPP pin function is $\overline{\text{MCLR}}$. MCLRE Configuration bit is ignored.
0 = HV on $\overline{\text{MCLR}}$/VPP must be used for programming.
The LVP bit cannot be written (to zero) while operating from the LVP programming interface. The purpose of this rule is to prevent the user from dropping out of LVP mode while programming from LVP mode, or accidentally eliminating LVP mode from the configuration state.
The preconditioned (erased) state for this bit is critical.

bit 12 **Unimplemented:** Read as '1'

bit 11 **$\overline{\text{WRTSAF}}$:** Storage Area Flash Write Protection bit
1 = SAF NOT write-protected
0 = SAF write-protected
Unimplemented, if SAF is not supported in the device family and only applicable if $\overline{\text{SAFEN}}$ = 0.

bit 10 **$\overline{\text{WRTD}}$:** Data EEPROM Write Protection bit
1 = Data EEPROM NOT write-protected
0 = Data EEPROM write-protected
Unimplemented if data EEPROM is not present.

bit 9 **$\overline{\text{WRTC}}$:** Configuration Register Write Protection bit
1 = Configuration Register NOT write-protected
0 = Configuration Register write-protected

bit 8 **$\overline{\text{WRTB}}$:** Boot Block Write Protection bit
1 = Boot Block NOT write-protected
0 = Boot Block write-protected
Only applicable if $\overline{\text{BBEN}}$ = 0.

bit 7 **$\overline{\text{WRTAPP}}$:** Application Block Write Protection bit
1 = Application Block NOT write-protected
0 = Application Block write-protected

bit 6-5 **Unimplemented:** Read as '1'.

bit 4 **$\overline{\text{SAFEN}}$:** SAF Enable bit
1 = SAF disabled
0 = SAF enabled

bit 3 **$\overline{\text{BBEN}}$:** Boot Block Enable bit
1 = Boot Block disabled
0 = Boot Block enabled

bit 2-0 **BBSIZE<2:0>:** Boot Block Size Selection bits
BBSIZE is used only when $\overline{\text{BBEN}}$ = 0
BBSIZ bits can only be written while $\overline{\text{BBEN}}$ = 1; after $\overline{\text{BBEN}}$ = 0, BBSIZ is write-protected.

Note 1: Bits are implemented as sticky bits. Once protection is enabled, it can only be reset through a Bulk Erase.

TABLE 5-1: BOOT BLOCK SIZE BITS

$\overline{\text{BBEN}}$	BBSIZE[2:0]	Actual Boot Block Size User Program Memory Size (words)			Last Boot Block Memory Access
		8k	16k	32k	
1	xxx	0	0	0	—
0	111	512	512	512	01FFh
0	110	1024	1024	1024	03FFh
0	101	2048	2048	2048	07FFh
0	100	4096	4096	4096	0FFFh
0	011	Note 1	8192	8192	1FFFh
0	010			16384	3FFFh
0	001				3FFFh
0	000				3FFFh

Note 1: The maximum boot block size is half the user program memory size. All selections higher than the maximum are set to half size. For example, all BBSIZE = 000 - 100 produce a boot block size of 4 kW on a 8 kW device.

'1' = Bit is set	'0' = Bit is cleared	HS = Hardware set

bit 7-6 **Unimplemented:** Read as '0'.

bit 5 **NVMIE:** NVM Interrupt Enable bit
- 1 = NVM task complete interrupt enabled
- 0 = NVM interrupt not enabled

bit 4-1 **Unimplemented:** Read as '0'.

bit 0 **CWG1IE:** Complementary Waveform Generator (CWG) Interrupt Enable bit
- 1 = CWG1 interrupt is enabled
- 0 = CWG1 interrupt disabled

Note: Bit PEIE of the INTCON register must be set to enable any peripheral interrupt controlled by registers PIE1-PIE8.

14.8 PORTD Registers

Note:	PORTD functionality is not available on the PIC16(L)F19155/56 family of devices.

14.8.1 DATA REGISTER

PORTD is an 8-bit wide, bidirectional port. The corresponding data direction register is TRISD (Register 14-2). Setting a TRISD bit (= 1) will make the corresponding PORTD pin an input (i.e., disable the output driver). Clearing a TRISD bit (= 0) will make the corresponding PORTD pin an output (i.e., enables output driver and puts the contents of the output latch on the selected pin). Example 14.2.8 shows how to initialize PORTD.

Reading the PORTD register (Register 14-1) reads the status of the pins, whereas writing to it will write to the PORT latch.

The PORT data latch LATD (Register 14-3) holds the output port data, and contains the latest value of a LATD or PORTD write.

EXAMPLE 14-3: INITIALIZING PORTD

```
; This code example illustrates
; initializing the PORTD register. The
; other ports are initialized in the same
; manner.

BANKSEL  PORTD        ;
CLRF     PORTD        ;Init PORTD
BANKSEL  LATD         ;Data Latch
CLRF     LATD         ;
BANKSEL  ANSELD       ;
CLRF     ANSELD       ;digital I/O
BANKSEL  TRISD        ;
MOVLW    B'00111000'  ;Set RD<5:3> as inputs
MOVWF    TRISD        ;and set RD<2:0> as
                      ;outputs
```

14.8.2 DIRECTION CONTROL

The TRISD register (Register 14-2) controls the PORTD pin output drivers, even when they are being used as analog inputs. The user should ensure the bits in the TRISD register are maintained set when using them as analog inputs. I/O pins configured as analog inputs always read '0'.

14.8.3 OPEN-DRAIN CONTROL

The ODCOND register (Register 14-6) controls the open-drain feature of the port. Open-drain operation is independently selected for each pin. When an ODCOND bit is set, the corresponding port output becomes an open-drain driver capable of sinking current only. When an ODCOND bit is cleared, the corresponding port output pin is the standard push-pull drive capable of sourcing and sinking current.

Note:	It is not necessary to set open-drain control when using the pin for I^2C; the I^2C module controls the pin and makes the pin open-drain.

14.8.4 SLEW RATE CONTROL

The SLRCOND register (Register 14-7) controls the slew rate option for each port pin. Slew rate control is independently selectable for each port pin. When an SLRCOND bit is set, the corresponding port pin drive is slew rate limited. When an SLRCOND bit is cleared, The corresponding port pin drive slews at the maximum rate possible.

14.8.5 INPUT THRESHOLD CONTROL

The INLVLD register (Register 14-8) controls the input voltage threshold for each of the available PORTD input pins. A selection between the Schmitt Trigger CMOS or the TTL Compatible thresholds is available. The input threshold is important in determining the value of a read of the PORTD register and also the level at which an interrupt-on-change occurs, if that feature is enabled. See Table 39-4 for more information on threshold levels.

Note:	Changing the input threshold selection should be performed while all peripheral modules are disabled. Changing the threshold level during the time a module is active may inadvertently generate a transition associated with an input pin, regardless of the actual voltage level on that pin.

REGISTER 14-35: LATE: PORTE DATA LATCH REGISTER

R/W-x/u	R/W-x/u	R/W-x/u	R/W-x/u	R/W-x/u	U-0	R/W-x/u	R/W-x/u
LATE7	LATE6	LATE5	LATE4	LATE3	—	LATE1	LATE0
bit 7							bit 0

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7-3 **LATE<7:3>**: RE<7:3> Output Latch Value bits(1)

bit 2 **Unimplemented:** Read as '0'

bit 1-0 **LATE<1:0>**: RE<1:0> Output Latch Value bits(1)

Note 1: Writes to PORTE are actually written to corresponding LATE register. Reads from PORTE register is return of actual I/O pin values.

REGISTER 14-36: ANSELE: PORTE ANALOG SELECT REGISTER

R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	R/W-1/1	U-0	R/W-1/1	R/W-1/1
ANSE7	ANSE6	ANSE5	ANSE4	ANSE3	—	ANSE1	ANSE0
bit 7							bit 0

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7-3 **ANSE<7:3>**: Analog Select between Analog or Digital Function on pins RE<7:3>, respectively
1 = Analog input. Pin is assigned as analog input(1). Digital input buffer disabled.
0 = Digital I/O. Pin is assigned to port or digital special function.

bit 2 **Unimplemented:** Read as '0'

bit 1-0 **ANSE<1:0>**: Analog Select between Analog or Digital Function on pins RE<1:0>, respectively
1 = Analog input. Pin is assigned as analog input(1). Digital input buffer disabled.
0 = Digital I/O. Pin is assigned to port or digital special function.

Note 1: When setting a pin to an analog input, the corresponding TRIS bit must be set to Input mode in order to allow external control of the voltage on the pin.

14.13 Register Definitions: PORTF

REGISTER 14-41: PORTF: PORTF REGISTER

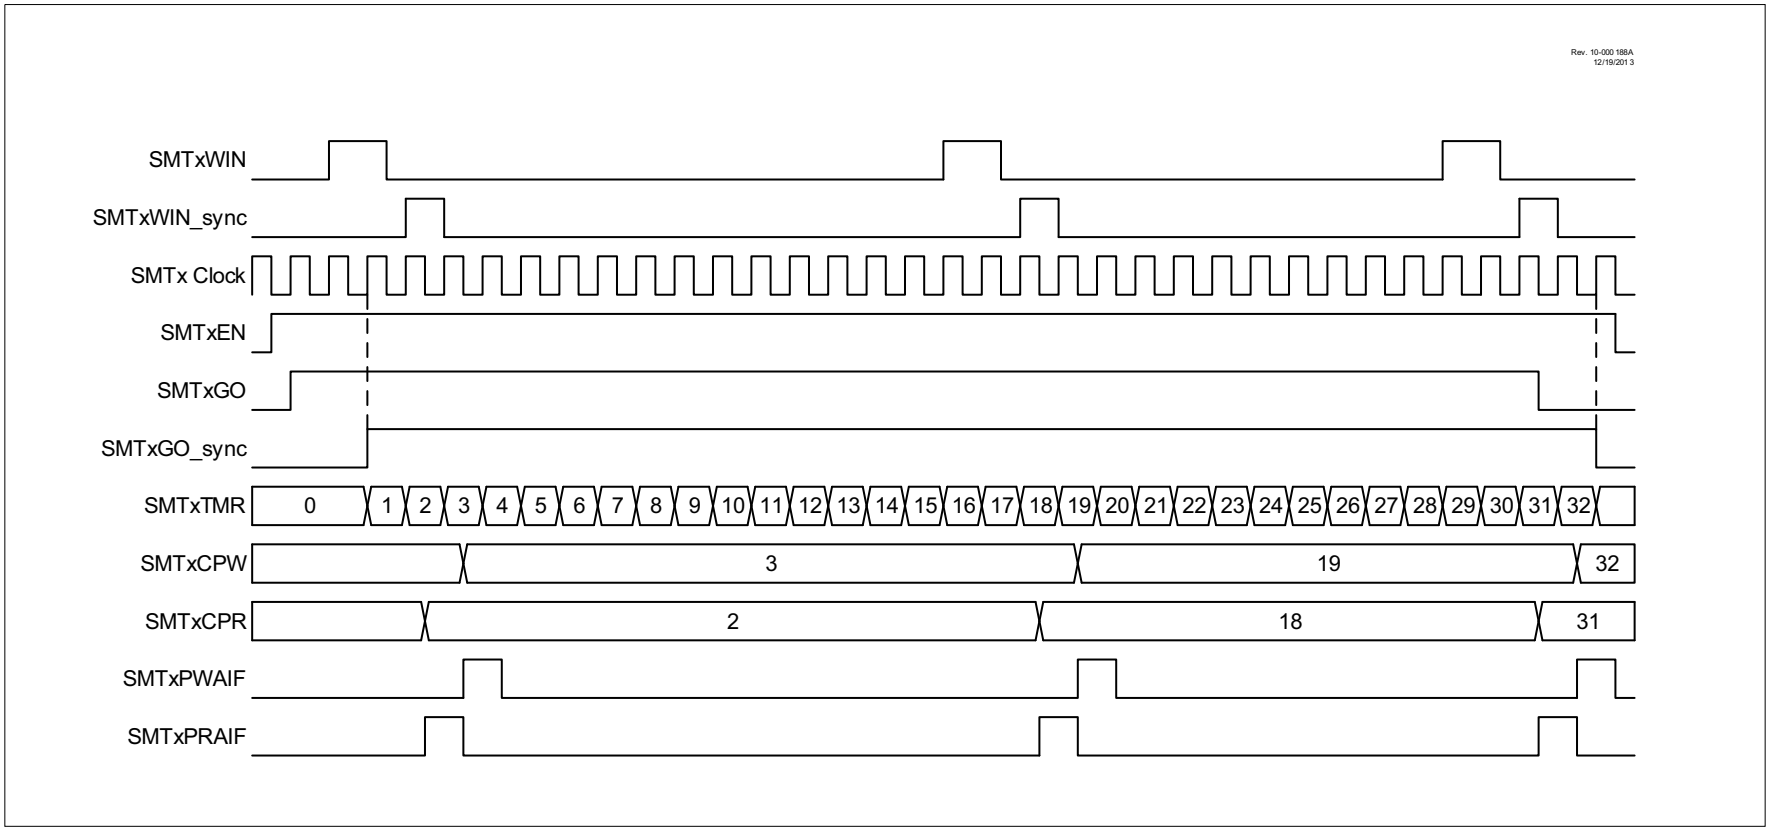
FIGURE 28-16: CAPTURE MODE REPEAT ACQUISITION TIMING DIAGRAM



31.10 Auto-Shutdown

Auto-shutdown is a method to immediately override the CWG output levels with specific overrides that allow for safe shutdown of the circuit. The shutdown state can be either cleared automatically or held until cleared by software. The auto-shutdown circuit is illustrated in Figure 31-12.

31.10.1 SHUTDOWN

The shutdown state can be entered by either of the following two methods:

- Software generated
- External input

31.10.1.1 Software Generated Shutdown

Setting the SHUTDOWN bit of the CWG1AS0 register will force the CWG into the shutdown state.

When the auto-restart is disabled, the shutdown state will persist as long as the SHUTDOWN bit is set.

When auto-restart is enabled, the SHUTDOWN bit will clear automatically and resume operation on the next rising edge event.

31.10.2 EXTERNAL INPUT SOURCE

External shutdown inputs provide the fastest way to safely suspend CWG operation in the event of a Fault condition. When any of the selected shutdown inputs goes active, the CWG outputs will immediately go to the selected override levels without software delay. Several input sources can be selected to cause a shutdown condition. All input sources are active-low. The sources are:

- Comparator C1OUT_sync
- Comparator C2OUT_sync
- Timer2 – TMR2_postscaled
- CWG1IN input pin

Shutdown inputs are selected using the CWG1AS1 register (Register 31-6).

Note:	Shutdown inputs are level sensitive, not edge sensitive. The shutdown state cannot be cleared, except by disabling auto-shutdown, as long as the shutdown input level persists.

31.11 Operation During Sleep

The CWG module operates independently from the system clock and will continue to run during Sleep, provided that the clock and input sources selected remain active.

The HFINTOSC remains active during Sleep when all the following conditions are met:

- CWG module is enabled
- Input source is active
- HFINTOSC is selected as the clock source, regardless of the system clock source selected.

In other words, if the HFINTOSC is simultaneously selected as the system clock and the CWG clock source, when the CWG is enabled and the input source is active, then the CPU will go idle during Sleep, but the HFINTOSC will remain active and the CWG will continue to operate. This will have a direct effect on the Sleep mode current.

34.1.1.5 TSR Status

The TRMT bit of the TXxSTA register indicates the status of the TSR register. This is a read-only bit. The TRMT bit is set when the TSR register is empty and is cleared when a character is transferred to the TSR register from the TXxREG. The TRMT bit remains clear until all bits have been shifted out of the TSR register. No interrupt logic is tied to this bit, so the user has to poll this bit to determine the TSR status.

Note:	The TSR register is not mapped in data memory, so it is not available to the user.

34.1.1.6 Transmitting 9-Bit Characters

The EUSART supports 9-bit character transmissions. When the TX9 bit of the TXxSTA register is set, the EUSART will shift nine bits out for each character transmitted. The TX9D bit of the TXxSTA register is the ninth, and Most Significant data bit. When transmitting 9-bit data, the TX9D data bit must be written before writing the eight Least Significant bits into the TXxREG. All nine bits of data will be transferred to the TSR shift register immediately after the TXxREG is written.

A special 9-bit Address mode is available for use with multiple receivers. See **Section 34.1.2.7 "Address Detection"** for more information on the Address mode.

34.1.1.7 Asynchronous Transmission Set-up:

1. Initialize the SPxBRGH, SPxBRGL register pair and the BRGH and BRG16 bits to achieve the desired baud rate (see **Section 34.3 "EUSART Baud Rate Generator (BRG)"**).
2. Enable the asynchronous serial port by clearing the SYNC bit and setting the SPEN bit.
3. If 9-bit transmission is desired, set the TX9 control bit. A set ninth data bit will indicate that the eight Least Significant data bits are an address when the receiver is set for address detection.
4. Set SCKP bit if inverted transmit is desired.
5. Enable the transmission by setting the TXEN control bit. This will cause the TXxIF interrupt bit to be set.
6. If interrupts are desired, set the TXxIE interrupt enable bit of the PIE3 register. An interrupt will occur immediately provided that the GIE and PEIE bits of the INTCON register are also set.
7. If 9-bit transmission is selected, the ninth bit should be loaded into the TX9D data bit.
8. Load 8-bit data into the TXxREG register. This will start the transmission.
