What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

8.0 OSCILLATOR CONFIGURATION

Note: This data sheet summarizes the features of the PIC32MZ DA family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 42. “Oscillators with Enhanced PLL”** (DS60001250) in the *“PIC32 Family Reference Manual”*, which is available from the Microchip web site (www.microchip.com/PIC32).

The PIC32MZ DA oscillator system has the following modules and features:

- Five external and internal oscillator options as clock sources
- On-Chip PLL with user-selectable input divider, multiplier and output divider to boost operating frequency on select internal and external oscillator sources
- On-Chip user-selectable divisor postscaler on select oscillator sources
- Software-controllable switching between various clock sources
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and permits safe application recovery or shut-down with dedicated Back-up FRC (BFRC)
- Dedicated On-Chip PLL for DDR2 and USB modules
- Flexible reference clock output
- Multiple clock branches for peripherals for better performance flexibility

A block diagram of the oscillator system is provided in Figure 8-1. The clock distribution is shown in Table 8-1.

NOTES:

23.0 INTER-INTEGRATED CIRCUIT (I²C)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 24. “Inter-Integrated Circuit (I²C)”** (DS60001116), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The I²C module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard.

Each I²C module has a 2-pin interface:

- SCLx pin is clock
- SDAx pin is data

Each I²C module offers the following key features:

- I²C interface supporting both master and slave operation
- I²C Slave mode supports 7-bit and 10-bit addressing
- I²C Master mode supports 7-bit and 10-bit addressing
- I²C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for the I²C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I²C supports multi-master operation; detects bus collision and arbitrates accordingly
- Provides support for address bit masking
- SMBus support

Figure 23-1 illustrates the I²C module block diagram.

34.0 HIGH/LOW-VOLTAGE DETECT (HLVD)

Note: This data sheet summarizes the features of the PIC32MZ Graphics (DA) Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 38. “High/Low-Voltage Detect (HLVD)”** (DS60001408), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The High/Low-Voltage Detect (HLVD) module is a programmable circuit that allows the user to specify both the device voltage trip point and the direction of change.

The HLVD module provides the following features:

- Hysteresis detection
- Low-to-high or high-to-low voltage change detection
- Generation of Non-Maskable Interrupts (NMI)
- LVDIN pin to provide external voltage trip point
