What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

2.9 Considerations When Interfacing to Remotely Powered Circuits

2.9.1 NON-5V TOLERANT INPUT PINS

A quick review of the absolute maximum rating section in **44.0 “Electrical Characteristics”** indicates that the voltage on any non-5v tolerant pin should not exceed $VDD + 0.3V$, unless the input current is limited to meet the respective injection current specifications defined by the parameters DI60a, DI60b, and DI60c as shown in Table 44-12.

Figure 2-5 illustrates a remote circuit using an independent power source, which is powered while connected to a PIC32 non-5V tolerant circuit that is not powered.

Without a proper signal isolation on non-5V tolerant pins, the remote signal can power the PIC32 device through the high side ESD protection diodes. Besides violating the absolute maximum rating specification when VDD of the PIC32 device is restored and ramping up or ramping down, it can also negatively affect the internal Power-on Reset (POR) and Brown-out Reset (BOR) circuits, which can lead to improper initialization of internal PIC32 logic circuits. In these cases, it is recommended to implement digital or analog signal isolation as shown in Figure 2-6. This is indicative of all industry microcontrollers and not just Microchip products.

REGISTER 11-9: USBIENCSR1: USB INDEXED ENDPOINT CONTROL STATUS REGISTER 1 (ENDPOINT 1-7) (CONTINUED)

- bit 26 **DATATWEN:** Data Toggle Write Enable Control bit (*Host mode*)
1 = DATATGGL can be written
0 = DATATGGL is not writable
- bit 25 **DATATGGL:** Data Toggle bit (*Host mode*)
When read, this bit indicates the current state of the endpoint data toggle.
If DATATWEN = 1, this bit may be written with the required setting of the data toggle.
If DATATWEN = 0, any value written to this bit is ignored.
- bit 24 **INCOMPRX:** Incomplete Packet Status bit
1 = The packet in the RX FIFO during a high-bandwidth Isochronous/Interrupt transfer is incomplete because parts of the data were not received
0 = Written by then software to clear this bit
In anything other than Isochronous transfer, this bit will always return 0.
- bit 23 **CLRD:** Clear Data Toggle Control bit
1 = Reset the endpoint data toggle to 0
0 = Leave endpoint data toggle alone
- bit 22 **SENTSTALL:** STALL Handshake Status bit (*Device mode*)
1 = STALL handshake is transmitted
0 = Written by the software to clear this bit
- RXSTALL:** STALL Handshake Receive Status bit (*Host mode*)
1 = A STALL handshake has been received. An interrupt is generated.
0 = Written by the software to clear this bit
- bit 21 **SENDSTALL:** STALL Handshake Control bit (*Device mode*)
1 = Issue a STALL handshake
0 = Terminate stall condition
- REQPKT:** IN Transaction Request Control bit (*Host mode*)
1 = Request an IN transaction.
0 = No request
This bit is cleared when RXPKTRDY is set.
- bit 20 **FLUSH:** Flush FIFO Control bit
1 = Flush the next packet to be read from the endpoint RX FIFO. The FIFO pointer is reset and the RXPKTRDY bit is cleared. This should only be used when RXPKTRDY is set. If the FIFO is double-buffered, FLUSH may need to be set twice to completely clear the FIFO.
0 = Normal FIFO operation
This bit is automatically cleared.
- bit 19 **DATAERR:** Data Packet Error Status bit (*Device mode*)
1 = The data packet has a CRC or bit-stuff error.
0 = No data error
This bit is cleared when RXPKTRDY is cleared. This bit is only valid when the endpoint is operating in ISO mode. In Bulk mode, it always returns zero.
- DERRNAKT:** Data Error/NAK Time-out Status bit (*Host mode*)
1 = The data packet has a CRC or bit-stuff error. In Bulk mode, the RX endpoint is halted following the receipt of NAK responses for longer than the time set as the NAK limit.
0 = No data or NAK time-out error

REGISTER 41-9: CFGCON: CONFIGURATION CONTROL REGISTER (CONTINUED)

bit 7 **IOANCPEN:** I/O Analog Charge Pump Enable bit

1 = Charge pumps are enabled

0 = Charge pumps are disabled

Note 1: For proper analog operation at VDD is less than 2.5V, the AICPMPE bit (ADCCON1<12>) must be = 1 and the IOANCPEN bit must be set to '1'; however, the charge pumps will consume additional current. These bits should not be set if VDD is greater than 2.5V.

2: ADC throughput rate performance is reduced as defined in the table below if ADCCON1<AICPMPE> = 1 and CFGCON<IOANCPEN> = 1.

Note 1: To change this bit, the unlock sequence must be performed. Refer to **Section 42. “Oscillators with Enhanced PLL”** (DS60001250) in the *“PIC32 Family Reference Manual”* for details.

2: The JTAGEN bit is only available at run-time when the JTAGEN (DEVCFG0<2>) fuse bit is set at start-up.

Note: These registers contain a value, programmed during factory production test, that is unique to each unit and are user read only. These values are persistent and not erased even when a new application code is programmed into the device. These values can be used if desired as an encryption key in combination with the Microchip encryption library.
