

Welcome to **E-XFL.COM** 

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded - Microcontrollers</u>"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	40/20MHz
Connectivity	UART/USART
Peripherals	POR, WDT
Number of I/O	32
Program Memory Size	16KB (16K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	256 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	44-PLCC (16.6x16.6)
Purchase URL	https://www.e-xfl.com/product-detail/atmel/at87c54x2-slrum

## 4. SFR Mapping

The Special Function Registers (SFRs) of the TS80C54/58X2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP, AUXR1
- I/O port registers: P0, P1, P2, P3
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- Power and clock control registers: PCON
- HDW Watchdog Timer Reset: WDTRST, WDTPRG
- Interrupt system registers: IE, IP, IPH
- Others: AUXR, CKCON

- Enter a 16-bit initial value in timer registers TH2/TL2. It can be the same as the reload value or a different one depending on the application.
- To start the timer, set TR2 run control bit in T2CON register.

It is possible to use timer 2 as a baud rate generator and a clock generator simultaneously. For this configuration, the baud rates and clock frequencies are not independent since both functions use the values in the RCAP2H and RCAP2L registers.

**Figure 8-2.** Clock-Out Mode  $C/\overline{T2} = 0$

## 9.1.1 Automatic Address Recognition

The automatic address recognition feature is enabled when the multiprocessor communication feature is enabled (SM2 bit in SCON register is set).

Implemented in hardware, automatic address recognition enhances the multiprocessor communication feature by allowing the serial port to examine the address of each incoming command frame. Only when the serial port recognizes its own address, the receiver sets RI bit in SCON register to generate an interrupt. This ensures that the CPU is not interrupted by command frames addressed to other devices.

If desired, you may enable the automatic address recognition feature in mode 1. In this configuration, the stop bit takes the place of the ninth data bit. Bit RI is set only when the received command frame address matches the device's address and is terminated by a valid stop bit.

To support automatic address recognition, a device is identified by a given address and a broadcast address.

NOTE: The multiprocessor communication and automatic address recognition features cannot be enabled in mode 0 (i.e. setting SM2 bit in SCON register in mode 0 has no effect).

#### 9.1.2 Given Address

Each device has an individual address that is specified in SADDR register; the SADEN register is a mask byte that contains don't-care bits (defined by zeros) to form the device's given address. The don't-care bits provide the flexibility to address one or more slaves at a time. The following example illustrates how a given address is formed.

To address a device by its individual address, the SADEN mask byte must be 1111 1111b. For example:

SADDR	0101	0110b
SADEN	1111	1100b
Given	0101	01XXb

Table 9-3.SCON Register

SCON - Serial Control Register (98h)

7	6	5	4	3	2	1	0
FE/SM0	SM1	SM2	REN	TB8	RB8	TI	RI

Bit Number	Bit Mnemonic	Description
7	FE	Framing Error bit (SMOD0=1)  Clear to reset the error state, not cleared by a valid stop bit.  Set by hardware when an invalid stop bit is detected.  SMOD0 must be set to enable access to the FE bit
	SM0	Serial port Mode bit 0 Refer to SM1 for serial port mode selection. SMOD0 must be cleared to enable access to the SM0 bit
6	SM1	Serial port Mode bit 1  SM0 SM1Mode Description Baud Rate  0 0 0 Shift RegisterFy_n/12 (/6 in X2 mode)
U	JIVI	0       0       Shift RegisterFXTAL/12 (/6 in X2 mode)         0       1       1       8-bit UARTVariable         1       0       2       9-bit UARTFXTAL/64 or FXTAL/32 (/32, /16 in X2 mode)         1       1       3       9-bit UARTVariable
5	SM2	Serial port Mode 2 bit / Multiprocessor Communication Enable bit Clear to disable multiprocessor communication feature. Set to enable multiprocessor communication feature in mode 2 and 3, and eventually mode 1. This bit should be cleared in mode 0.
4	REN	Reception Enable bit Clear to disable serial reception. Set to enable serial reception.
3	TB8	Transmitter Bit 8 / Ninth bit to transmit in modes 2 and 3.  Clear to transmit a logic 0 in the 9th bit.  Set to transmit a logic 1 in the 9th bit.
2	RB8	Receiver Bit 8 / Ninth bit received in modes 2 and 3  Cleared by hardware if 9th bit received is a logic 0.  Set by hardware if 9th bit received is a logic 1.  In mode 1, if SM2 = 0, RB8 is the received stop bit. In mode 0 RB8 is not used.
1	TI	Transmit Interrupt flag Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0 or at the beginning of the stop bit in the other modes.
0	RI	Receive Interrupt flag Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0, see Figure 9-2. and Figure 9-3. in the other modes.

Reset Value = XX00 0000b

Not bit addressable

Figure 11-1. Power-Down Exit Waveform

Exit from power-down by reset redefines all the SFRs, exit from power-down by external interrupt does no affect the SFRs.

Exit from power-down by either reset or external interrupt does not affect the internal RAM content.

NOTE: If idle mode is activated with power-down mode (IDL and PD bits set), the exit sequence is unchanged, when execution is vectored to interrupt, PD and IDL bits are cleared and idle mode is not entered.

**Table 11-1.** The state of ports during idle and power-down modes

Mode	Program Memory	ALE	PSEN	PORT0	PORT1	PORT2	PORT3
Idle	Internal	1	1	Port Data*	Port Data	Port Data	Port Data

#### 12.1.1 WDT during Power Down and Idle

In Power Down mode the oscillator stops, which means the WDT also stops. While in Power Down mode the user does not need to service the WDT. There are 2 methods of exiting Power Down mode: by a hardware reset or via a level activated external interrupt which is enabled prior to entering Power Down mode. When Power Down is exited with hardware reset, servicing the WDT should occur as it normally should whenever the TS80C54/58X2 is reset. Exiting Power Down with an interrupt is significantly different. The interrupt is held low long enough for the oscillator to stabilize. When the interrupt is brought high, the interrupt is serviced. To prevent the WDT from resetting the device while the interrupt pin is held low, the WDT is not started until the interrupt is pulled high. It is suggested that the WDT be reset during the interrupt service routine.

To ensure that the WDT does not overflow within a few states of exiting of powerdown, it is best to reset the WDT just before entering powerdown.

In the Idle mode, the oscillator continues to run. To prevent the WDT from resetting the TS80C54/58X2 while in Idle mode, the user should always set up a timer that will periodically exit Idle, service the WDT, and re-enter Idle mode.

## 14. Power-Off Flag

The power-off flag allows the user to distinguish between a "cold start" reset and a "warm start" reset.

A cold start reset is the one induced by  $V_{CC}$  switch-on. A warm start reset occurs while  $V_{CC}$  is still applied to the device and could be generated for example by an exit from power-down.

The power-off flag (POF) is located in PCON register (See Table 14-1.). POF is set by hardware when  $V_{CC}$  rises from 0 to its nominal voltage. The POF can be set or cleared by software allowing the user to determine the type of reset.

The POF value is only relevant with a Vcc range from 4.5V to 5.5V. For lower Vcc value, reading POF bit will return indeterminate value.

**Table 14-1.** PCON Register PCON - Power Control Register (87h)

7	6	5	4	3	2	1	0

6 SMOD0 Serial port Mode bit 0 Clear to select SM0 bit in SCON register. Set to to select FE bit in SCON register.					
5	-	Reserved The value read from this bit is indeterminate. Do not set this bit.			
4	POF	Power-Off Flag Clear to recognize next reset type. Set by hardware when V <sub>CC</sub> rises from 0 to its nominal voltage. Can also be set by software.			
3	GF1	General purpose Flag Cleared by user for general purpose usage. Set by user for general purpose usage.			
2	GF0	General purpose Flag Cleared by user for general purpose usage. Set by user for general purpose usage.			
1	PD	Power-Down mode bit Cleared by hardware when reset occurs. Set to enter power-down mode.			
0	IDL	Idle mode bit Clear by hardware when interrupt or reset occurs. Set to enter idle mode.			

Reset Value = 00X1 0000b

Not bit addressable

# 15. Reduced EMI Mode

The ALE signal is used to demultiplex address and data buses on port 0 when used with external program or data memory. Nevertheless, during internal code execution, ALE signal is still generated. In order to reduce EMI, ALE signal can be disabled by setting AO bit.

The AO bit is located in AUXR register at bit location 0. As soon as AO is set, ALE is no longer output but remains active during MOVX and MOVC instructions and external fetches. During ALE disabling, ALE pin is weakly pulled high.

**Table 15-1.** AUXR Register AUXR - Auxiliary Register (8Eh)

7	6	5	4	3	2	1	0
-	-	-	-	-	-	RESERVED	AO

Bit Number	Bit Mnemonic	Description

## 19. Electrical Characteristics

## 19.1 Absolute Maximum Ratings (1)

Ambiant Temperature Under Bias:

 $C = commercial0^{\circ}C \text{ to } 70^{\circ}C$ 

I = industrial -40°C to 85°C

Storage Temperature-65°C to + 150°C

Voltage on  $V_{CC}$  to  $V_{SS}$ -0.5 V to + 7 V

Voltage on  $V_{PP}$  to  $V_{SS}$ -0.5 V to + 13 V

Voltage on Any Pin to  $V_{SS}$ -0.5 V to  $V_{CC}$  + 0.5 V

Power Dissipation1 W<sup>(2)</sup>

- Stresses at or above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
- 2. This value is based on the maximum allowable die temperature and the thermal resistance of the package.

## 19.2 Power consumption measurement

Since the introduction of the first C51 devices, every manufacturer made operating lcc measurements under reset, which made sense for the designs were the CPU was running under reset. In Atmel new devices, the CPU is no more active during reset, so the power consumption is very low but is not really representative of what will happen in the customer system. That's why, while keeping measurements under Reset, Atmel presents a new way to measure the operating lcc:

Using an internal test ROM, the following code is executed:

Label: SJMP Label (80 FE)

Ports 1, 2, 3 are disconnected, Port 0 is tied to FFh, EA = Vcc, RST = Vss, XTAL2 is not connected and XTAL1 is driven by the clock.

This is much more representative of the real operating lcc.

## 19.3 DC Parameters for Standard Voltage

TA = 0°C to +70°C;  $V_{SS}$  = 0 V;  $V_{CC}$  = 5 V ± 10%; F = 0 to 40 MHz. TA = -40°C to +85°C;  $V_{SS}$  = 0 V;  $V_{CC}$  = 5 V ± 10%; F = 0 to 40 MHz.

**Table 19-1.** DC Parameters in Standard Voltage

I <sub>cc</sub> operating	Power Supply Current Maximum values, X1 mode: (7)			3 + 0.6 Freq (MHz) @12MHz 10.2 @16MHz 12.6	mA	V <sub>CC</sub> = 5.5 V <sup>(8)</sup>
I <sub>CC</sub> idle	Power Supply Current Maximum values, X1 mode: (7)			0.25+0.3 Freq (MHz) @12MHz 3.9 @16MHz 5.1	mA	V <sub>CC</sub> = 5.5 V <sup>(2)</sup>

- Typicals are based on a limited number of samples and are not guaranteed. The values listed are at room temperature and 5V.
- 6. Under steady state (non-transient) conditions, I<sub>OL</sub> must be externally limited as follows:

Maximum I<sub>OL</sub> per port pin: 10 mA

Maximum I<sub>OL</sub> per 8-bit port:

Port 0: 26 mA

Ports 1, 2 and 3: 15 mA

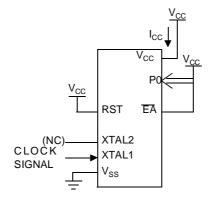

Maximum total I<sub>OI</sub> for all output pins: 71 mA

If  $I_{OL}$  exceeds the test condition,  $V_{OL}$  may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

- 7. For other values, please contact your sales office.
- 8. Operating  $I_{CC}$  is measured with all output pins disconnected; XTAL1 driven with  $T_{CLCH}$ ,  $T_{CHCL}$  = 5 ns (see Figure 19-5.),  $V_{IL} = V_{SS} + 0.5 \text{ V}$ ,

 $V_{IH} = V_{CC} - 0.5V$ ; XTAL2 N.C.;  $\overline{EA} = Port \ 0 = V_{CC}$ ; RST =  $V_{SS}$ . The internal ROM runs the code 80 FE (label: SJMP label).  $I_{CC}$  would be slightly higher if a crystal oscillator is used. Measurements are made with OTP products when possible, which is the worst case.

#### 19.5.12 External Clock Drive Waveforms

Figure 19-11. External Clock Drive Waveforms

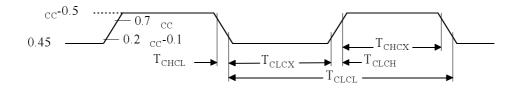

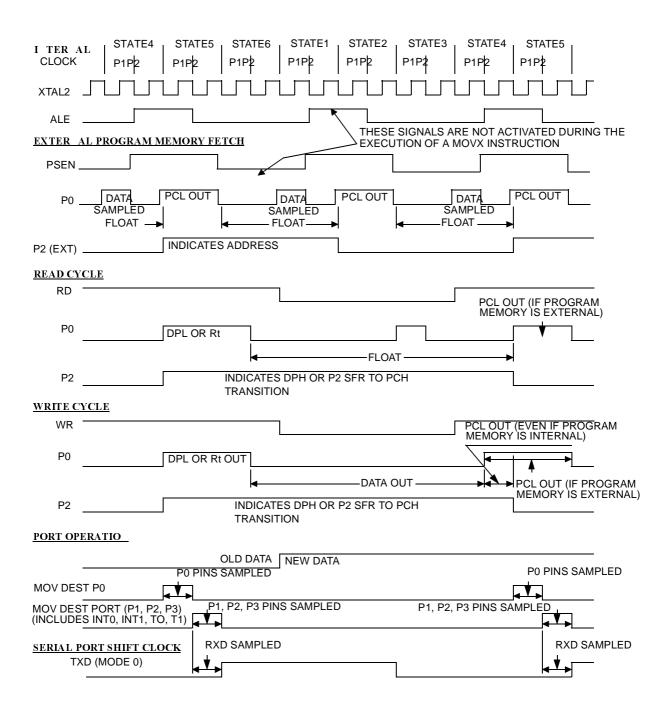

Figure 19-14. Clock Waveforms

This diagram indicates when signals are clocked internally. The time it takes the signals to propagate to the pins, however, ranges from 25 to 125 ns. This propagation delay is dependent on variables such as temperature and pin loading. Propagation also varies from output to output and component. Typically though ( $T_A=25^{\circ}C$  fully loaded)  $\overline{RD}$  and  $\overline{WR}$  propagation delays are approximately 50ns. The other signals are typically 85 ns. Propagation delays are incorporated in the AC specifications.
