Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

The following table lists the embedded operating flash limits.

Table 6 • Embedded Operating Flash Limits

Product Grade	Element	Programming Temperature	Maximum Operating Temperature	Programming Cycles	Retention (Biased/Unbiased)
Commercial	Embedded flash	Min T_J = 0 °C Max T_J = 85 °C	Min T_J = 0 °C Max T_J = 85 °C	< 1000 cycles per page, up to two million cycles per eNVM array	20 years
			Min T_J = 0 °C Max T_J = 85 °C	< 10000 cycles per page, up to 20 million cycles per eNVM array	10 years
Industrial	Embedded flash	Min T_J = –40 °C Max T_J = 100 °C	Min T_J = –40 °C Max T_J = 100 °C	< 1000 cycles per page, up to two million cycles per eNVM array	20 years
			Min T_J = –40 °C Max T_J = 100 °C	< 10000 cycles per page, up to 20 million cycles per eNVM array	10 years

Note: If your product qualification requires accelerated programming cycles, see *Microsemi SoC Products Quality and Reliability Report* about recommended methodologies.

Table 7 • Device Storage Temperature and Retention

Product Grade	Storage Temperature (Tstg)	Retention
Commercial	Min T_J = 0 °C Max T_J = 85 °C	20 years
Industrial	Min T_J = –40 °C Max T_J = 100 °C	20 years

FCV484	16.21	13.11	11.84	6.73	0.10	°C/W

2.3.1.2.1 Theta-JA

Junction-to-ambient thermal resistance (θ_{JA}) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in the actual performance of the product. It must be used with caution, but it is useful for comparing the thermal performance of one package with another.

The maximum power dissipation allowed is calculated using EQ4.

$$\text{Maximum power allowed} = \frac{T_{J(MAX)} - T_{A(MAX)}}{\theta_{JA}}$$

EQ 4

The absolute maximum junction temperature is 100 °C. EQ5 shows a sample calculation of the absolute maximum power dissipation allowed for the M2GL050T-FG896 package at commercial temperature and in still air, where:

θ_{JA} = 14.7 °C/W (taken from Table 9, page 10).

T_A = 85 °C

$$\text{Maximum power allowed} = \frac{100\ ^\circ\text{C} - 85\ ^\circ\text{C}}{14.7\ ^\circ\text{C/W}} = 1.088\ \text{W}$$

EQ 5

The power consumption of a device can be calculated using the Microsemi SoC Products Group power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package.

If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink may be attached to the top of the case, or the airflow inside the system must be increased.

2.3.1.2.2 Theta-JB

Junction-to-board thermal resistance (θ_{JB}) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal resistance from the junction to the board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5.0 mm away from the package edge.

2.3.1.2.3 Theta-JC

Junction-to-case thermal resistance (θ_{JC}) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable to packages used with external heat sinks. Constant temperature is applied to the surface, which acts as a boundary condition.

This only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration.

2.3.1.3 ESD Performance

See *RT0001: Microsemi Corporation - SoC Products Reliability Report* for information about ESD.
