### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

### 2.3.6.3 Stub-Series Terminated Logic 2.5 V (SSTL2)

SSTL2 Class I and Class II are supported in IGLOO2 and SmartFusion2 SoC FPGAs and also comply with reduced and full drive of double data rate (DDR) standards. IGLOO2 and SmartFusion2 SoC FPGA I/Os supports both standards for single-ended signaling and differential signaling for SSTL2. This standard requires a differential amplifier input buffer and a push-pull output buffer.

### 2.3.14 Math Block Timing Characteristics

The fundamental building block in any digital signal processing algorithm is the multiply-accumulate function. Each IGLOO2 and SmartFusion2 SoC math block supports  $18 \times 18$  signed multiplication, dot product, and built-in addition, subtraction, and accumulation units to combine multiplication results efficiently. ### 2.3.16 SRAM PUF

For more details on static random-access memory (SRAM) physical unclonable functions (PUF) services, see [AC434: Using SRAM PUF System Service in SmartFusion2 Application Note](#).

The following table lists the SRAM PUF in worst-case industrial conditions when  $T_J = 100\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 1.14\text{ V}$ .
