### **Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems**

**Embedded - System On Chip (SoC)** refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

### **What are Embedded - System On Chip (SoC)?**

**System On Chip (SoC)** integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

**Table 9 • Package Thermal Resistance of SmartFusion2 and IGLOO2 Devices (continued)**

Device	Still Air	1.0 m/s	2.5 m/s	$\theta_{JB}$	$\theta_{JC}$	Unit
	$\theta_{JA}$					
<b>150</b>

FCS536	15.01	12.06	10.76	3.69	1.55	°C/W
FCV484	16.21	13.11	11.84	6.73	0.10	°C/W

### 2.3.1.2.1 Theta-JA

Junction-to-ambient thermal resistance ( $\theta_{JA}$ ) is determined under standard conditions specified by JEDEC (JESD-51), but it has little relevance in the actual performance of the product. It must be used with caution, but it is useful for comparing the thermal performance of one package with another.

The maximum power dissipation allowed is calculated using EQ4.

$$\text{Maximum power allowed} = \frac{T_{J(\text{MAX})} - T_{A(\text{MAX})}}{\theta_{JA}}$$

EQ 4

The absolute maximum junction temperature is 100 °C. EQ5 shows a sample calculation of the absolute maximum power dissipation allowed for the M2GL050T-FG896 package at commercial temperature and in still air, where:

$$\begin{aligned}\theta_{JA} &= 14.7 \text{ °C/W (taken from Table 9, page 10).} \\ T_A &= 85 \text{ °C}\end{aligned}$$

$$\text{Maximum power allowed} = \frac{100 \text{ °C} - 85 \text{ °C}}{14.7 \text{ °C/W}} = 1.088 \text{ W}$$

EQ 5

The power consumption of a device can be calculated using the Microsemi SoC Products Group power calculator. The device's power consumption must be lower than the calculated maximum power dissipation by the package.

If the power consumption is higher than the device's maximum allowable power dissipation, a heat sink may be attached to the top of the case, or the airflow inside the system must be increased.

### 2.3.1.2.2 Theta-JB

Junction-to-board thermal resistance ( $\theta_{JB}$ ) measures the ability of the package to dissipate heat from the surface of the chip to the PCB. As defined by the JEDEC (JESD-51) standard, the thermal resistance from the junction to the board uses an isothermal ring cold plate zone concept. The ring cold plate is simply a means to generate an isothermal boundary condition at the perimeter. The cold plate is mounted on a JEDEC standard board with a minimum distance of 5.0 mm away from the package edge.

### 2.3.1.2.3 Theta-JC

Junction-to-case thermal resistance ( $\theta_{JC}$ ) measures the ability of a device to dissipate heat from the surface of the chip to the top or bottom surface of the package. It is applicable to packages used with external heat sinks. Constant temperature is applied to the surface, which acts as a boundary condition.

This only applies to situations where all or nearly all of the heat is dissipated through the surface in consideration.

### 2.3.1.3 ESD Performance

See *RT0001: Microsemi Corporation - SoC Products Reliability Report* for information about ESD.

## 2.3.5 User I/O Characteristics

There are three types of I/Os supported in the IGLOO2 FPGA and SmartFusion2 SoC FPGA families: MSIO, MSIOD, and DDRIO I/O banks. The I/O standards supported by the different I/O banks is described in the I/Os section of the *UG0445: IGLOO2 FPGA and SmartFusion2 SoC FPGA Fabric User Guide*.

### 2.3.5.1 Input Buffer and AC Loading

1. Delay increases with drive strength are inherent to built-in slew control circuitry for simultaneous switching output (SSO) management.

### 2.3.5.10 1.2 V LVCMOS

LVCMOS 1.2 is a general standard for 1.2 V applications and is supported in IGLOO2 FPGAs and SmartFusion2 SoC FPGAs in compliance to the JEDEC specification JESD8-12A.

## 2.3.14 Math Block Timing Characteristics

The fundamental building block in any digital signal processing algorithm is the multiply-accumulate function. Each IGLOO2 and SmartFusion2 SoC math block supports 18×18 signed multiplication, dot product, and built-in addition, subtraction, and accumulation units to combine multiplication results efficiently. The following table lists the math blocks with all registers used in worst commercial-case conditions when  $T_J = 85\text{ }^\circ\text{C}$ ,  $V_{DD} = 1.14\text{ V}$ .

**Table 303 • I2C Characteristics (continued)**

Parameter	Symbol	Min	Typ	Max	Unit	Conditions
Maximum data rate	$D_{MAX}$			400	Kbps	Fast mode
				100	Kbps	Standard mode
Pulse width of spikes which must be suppressed by the input filter	$T_{FILT}$		50		ns	Fast mode

1. These values are provided for MSIO Bank–LVTTTL 8 mA Low Drive at 25 °C, typical conditions. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the SoC Products Group website: <http://www.microsemi.com/soc/download/ibis/default.aspx>.
2. These maximum values are provided for information only. Minimum output buffer resistance values depend on  $V_{DDIX}$ , drive strength selection, temperature, and process. For board design considerations and detailed output buffer resistances, use the corresponding IBIS models located on the SoC Products Group website: <http://www.microsemi.com/soc/download/ibis/default.aspx>.
3.  $R(PULL-DOWN-MAX) = (VOLspec)/IOLspec$ .
4.  $R(PULL-UP-MAX) = (VDDImax-VOHspec)/IOHspec$ .

The following table lists the I<sup>2</sup>C switching characteristics in worst-case industrial conditions when  $T_J = 100\text{ °C}$ ,  $V_{DD} = 1.14\text{ V}$
