Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

2. SerDes and DDR blocks to be unused.
3. V_{DDIx} has been set to ON for test conditions as described. Banks on the east side should always be powered with the appropriate V_{DDI} bank supplies. For details on bank power supplies, see "Recommendation for Unused Bank Supplies" table in the *AC393: SmartFusion2 and IGLOO2 Board Design Guidelines Application Note*.
4. No Differential (that is to say, LVDS) I/Os or ODT attributes to be used.
