

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	XCore
Core Size	32-Bit 16-Core
Speed	2000MIPS
Connectivity	USB
Peripherals	-
Number of I/O	81
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	512K x 8
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	128-TQFP Exposed Pad
Supplier Device Package	128-TQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/xmos/xu216-512-tq128-c20">https://www.e-xfl.com/product-detail/xmos/xu216-512-tq128-c20</a>

## 1 xCORE Multicore Microcontrollers

The xCORE-200 Series is a comprehensive range of 32-bit multicore microcontrollers that brings the low latency and timing determinism of the xCORE architecture to mainstream embedded applications. Unlike conventional microcontrollers, xCORE multicore microcontrollers execute multiple real-time tasks simultaneously and communicate between tasks using a high speed network. Because xCORE multicore microcontrollers are completely deterministic, you can write software to implement functions that traditionally require dedicated hardware.

**Figure 1:**  
XU216-512-  
TQ128 block  
diagram

Key features of the XU216-512-TQ128 include:

- ▶ **Tiles:** Devices consist of one or more xCORE tiles. Each tile contains between five and eight 32-bit xCOREs with highly integrated I/O and on-chip memory.
- ▶ **Logical cores** Each logical core can execute tasks such as computational code, DSP code, control software (including logic decisions and executing a state machine) or software that handles I/O. Section [6.1](#)
- ▶ **xTIME scheduler** The xTIME scheduler performs functions similar to an RTOS, in hardware. It services and synchronizes events in a core, so there is no requirement for interrupt handler routines. The xTIME scheduler triggers cores on events generated by hardware resources such as the I/O pins, communication channels and timers. Once triggered, a core runs independently and concurrently to other cores, until it pauses to wait for more events. Section [6.2](#)
- ▶ **Channels and channel ends** Tasks running on logical cores communicate using channels formed between two channel ends. Data can be passed synchronously or asynchronously between the channel ends assigned to the communicating tasks. Section [6.5](#)
- ▶ **xCONNECT Switch and Links** Between tiles, channel communications are implemented over a high performance network of xCONNECT Links and routed through a hardware xCONNECT Switch. Section [6.6](#)

## 2 XU216-512-TQ128 Features

### ► Multicore Microcontroller with Advanced Multi-Core RISC Architecture

- 16 real-time logical cores on 2 xCORE tiles
- Cores share up to 1000 MIPS
  - Up to 2000 MIPS in dual issue mode
- Each logical core has:
  - Guaranteed throughput of between  $\frac{1}{5}$  and  $\frac{1}{8}$  of tile MIPS
  - 16x32bit dedicated registers
- 167 high-density 16/32-bit instructions
  - All have single clock-cycle execution (except for divide)
  - 32x32→64-bit MAC instructions for DSP, arithmetic and user-definable cryptographic functions

### ► USB PHY, fully compliant with USB 2.0 specification

### ► Programmable I/O

- 81 general-purpose I/O pins, configurable as input or output
  - Up to 25 x 1bit port, 12 x 4bit port, 8 x 8bit port, 4 x 16bit port
  - 4 xCONNECT links
- Port sampling rates of up to 60 MHz with respect to an external clock
- 64 channel ends (32 per tile) for communication with other cores, on or off-chip

### ► Memory

- 512KB internal single-cycle SRAM (max 256KB per tile) for code and data storage
- 16KB internal OTP (max 8KB per tile) for application boot code

### ► Hardware resources

- 12 clock blocks (6 per tile)
- 20 timers (10 per tile)
- 8 locks (4 per tile)

### ► JTAG Module for On-Chip Debug

### ► Security Features

- Programming lock disables debug and prevents read-back of memory contents
- AES bootloader ensures secrecy of IP held on external flash memory

### ► Ambient Temperature Range

- Commercial qualification: 0°C to 70°C
- Industrial qualification: -40°C to 85°C

### ► Speed Grade

- 20: 1000 MIPS

### ► Power Consumption

- 570 mA (typical)

### ► 128-pin TQFP package 0.4 mm pitch

### 3 Pin Configuration

**Figure 5:**  
Clock block  
diagram

A clock block can use a 1-bit port as its clock source allowing external application clocks to be used to drive the input and output interfaces. xCORE-200 clock blocks optionally divide the clock input from a 1-bit port.

In many cases I/O signals are accompanied by strobing signals. The xCORE ports can input and interpret strobe (known as readyIn and readyOut) signals generated by external sources, and ports can generate strobe signals to accompany output data.

On reset, each port is connected to clock block 0, which runs from the xCORE Tile reference clock.

## 6.5 Channels and Channel Ends

Logical cores communicate using point-to-point connections, formed between two channel ends. A channel-end is a resource on an xCORE tile, that is allocated by the program. Each channel-end has a unique system-wide identifier that comprises a unique number and their tile identifier. Data is transmitted to a channel-end by an output-instruction; and the other side executes an input-instruction. Data can be passed synchronously or asynchronously between the channel ends.

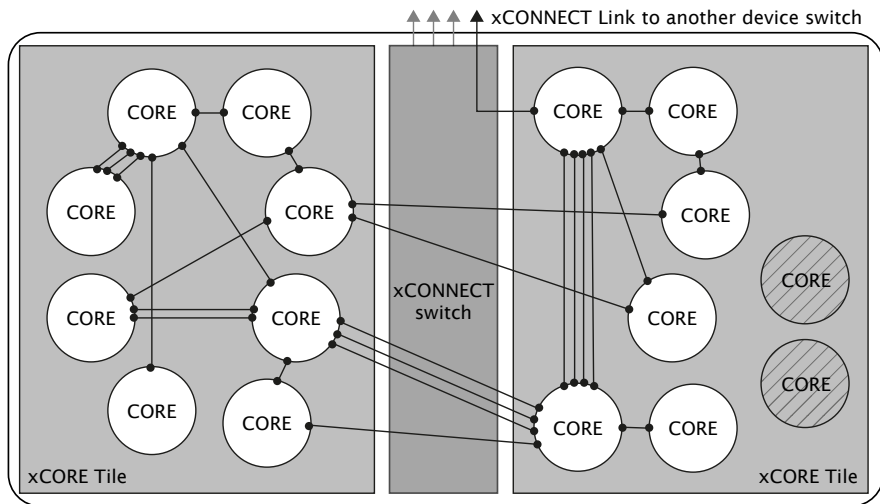

## 6.6 xCONNECT Switch and Links

XMOS devices provide a scalable architecture, where multiple xCORE devices can be connected together to form one system. Each xCORE device has an xCONNECT interconnect that provides a communication infrastructure for all tasks that run on the various xCORE tiles on the system.

The interconnect relies on a collection of switches and XMOS links. Each xCORE device has an on-chip switch that can set up circuits or route data. The switches are connected by xConnect Links. An XMOS link provides a physical connection between two switches. The switch has a routing algorithm that supports many different topologies, including lines, meshes, trees, and hypercubes.

The links operate in either 2 wires per direction or 5 wires per direction mode, depending on the amount of bandwidth required. Circuit switched, streaming

**Figure 6:**  
Switch, links  
and channel  
ends

and packet switched data can both be supported efficiently. Streams provide the fastest possible data rates between xCORE Tiles (up to 250 MBit/s), but each stream requires a single link to be reserved between switches on two tiles. All packet communications can be multiplexed onto a single link.

Information on the supported routing topologies that can be used to connect multiple devices together can be found in the XS1-U Link Performance and Design Guide, [X2999](#).

## 7 PLL

The PLL creates a high-speed clock that is used for the switch, tile, and reference clock. The initial PLL multiplication value is shown in Figure 7:

**Figure 7:**  
The initial PLL  
multiplier  
values

Oscillator Frequency	Tile Boot Frequency	PLL Ratio	PLL settings		
			OD	F	R
9-25 MHz	144-400 MHz	16	1	63	0

Figure 7 also lists the values of *OD*, *F* and *R*, which are the registers that define the ratio of the tile frequency to the oscillator frequency:

$$F_{core} = F_{osc} \times \frac{F + 1}{2} \times \frac{1}{R + 1} \times \frac{1}{OD + 1}$$

*OD*, *F* and *R* must be chosen so that  $0 \leq R \leq 63$ ,  $0 \leq F \leq 4095$ ,  $0 \leq OD \leq 7$ , and  $260MHz \leq F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \leq 1.3GHz$ . The *OD*, *F*, and *R* values can be modified by writing to the digital node PLL configuration register.

- A 32-bit CRC, or the value 0x0D15AB1E to indicate that no CRC check should be performed.

The program size and CRC are stored least significant byte first. The program is loaded into the lowest memory address of RAM, and the program is started from that address. The CRC is calculated over the byte stream represented by the program size and the program itself. The polynomial used is 0xEDB88320 (IEEE 802.3); the CRC register is initialized with 0xFFFFFFFF and the residue is inverted to produce the CRC.

## 8.1 Boot from QSPI master

If set to boot from QSPI master, the processor enables the six pins specified in Figure 10, and drives the SPI clock at 50 MHz (assuming a 400 MHz core clock). A READ command is issued with a 24-bit address 0x000000. The clock polarity and phase are 0 / 0.

**Figure 10:**  
QSPI pins

Pin	Signal	Description
X0D01	SS	Slave Select
X0D04..X0D07	SPIO	Data
X0D10	SCLK	Clock

The xCORE Tile expects each byte to be transferred with the *least-significant nibble first*. Programmers who write bytes into an QSPI interface using the most significant nibble first may have to reverse the nibbles in each byte of the image stored in the QSPI device.

The pins used for QSPI boot are hardcoded in the boot ROM and cannot be changed. If required, an QSPI boot program can be burned into OTP that uses different pins.

## 8.2 Boot from SPI master

If set to boot from SPI master, the processor enables the four pins specified in Figure 11, and drives the SPI clock at 2.5 MHz (assuming a 400 MHz core clock). A READ command is issued with a 24-bit address 0x000000. The clock polarity and phase are 0 / 0.

**Figure 11:**  
SPI master  
pins

Pin	Signal	Description
X0D00	MISO	Master In Slave Out (Data)
X0D01	SS	Slave Select
X0D10	SCLK	Clock
X0D11	MOSI	Master Out Slave In (Data)

The xCORE Tile expects each byte to be transferred with the *least-significant bit first*. Programmers who write bytes into an SPI interface using the most significant bit first may have to reverse the bits in each byte of the image stored in the SPI device.

(for example, 100nF 0402 for each supply pin). The ground side of the decoupling capacitors should have as short a path back to the GND pins as possible. A bulk decoupling capacitor of at least 10 uF should be placed on each of these supplies.

RST\_N is an active-low asynchronous-assertion global reset signal. Following a reset, the PLL re-establishes lock after which the device boots up according to the boot mode (see §8). RST\_N must be asserted low during and after power up for 100 ns.

## 12.1 USB connections

USB\_VBUS should be connected to the VBUS pin of the USB connector. A 2.2 uF capacitor to ground is required on the VBUS pin. A ferrite bead may be used to reduce HF noise.

For self-powered systems, a bleeder resistor may be required to stop VBUS from floating when no USB cable is attached.

USB\_DP and USB\_DN should be connected to the USB connector. USB\_ID does not need to be connected.

## 12.2 USB signal routing and placement

The USB\_DP and USB\_DN lines are the positive and negative data polarities of a high speed USB signal respectively. Their high-speed differential nature implies that they must be coupled and properly isolated. The board design must ensure that the board traces for USB\_DP and USB\_DN are tightly matched. In addition, according to the USB 2.0 specification, the USB\_DP and USB\_DN differential impedance must be 90  $\Omega$ .

**Figure 19:**  
USB trace separation showing a low speed signal, two differential pairs and a high-speed clock

### 12.2.1 General routing and placement guidelines

The following guidelines will help to avoid signal quality and EMI problems on high speed USB designs. They relate to a four-layer (Signal, GND, Power, Signal) PCB.

For best results, most of the routing should be done on the top layer (assuming the USB connector and XS2-U16A-512-TQ128 are on the top layer) closest to GND.

- ▶ DO NOT route USB traces near clock sources, clocked circuits or magnetic devices.
- ▶ Avoid stubs on high speed USB signals.

### 12.3 Land patterns and solder stencils

The package is a 128 pin Thin Quad Flat Package (TQFP) with exposed ground paddle/heat slug on a 0.4mm pitch.

The land patterns and solder stencils will depend on the PCB manufacturing process. We recommend you design them with using the IPC specifications “*Generic Requirements for Surface Mount Design and Land Pattern Standards*” [IPC-7351B](#). This standard aims to achieve desired targets of heel, toe and side fillets for solder-joints. The mechanical drawings in Section [14](#) specify the dimensions and tolerances.

### 12.4 Ground and Thermal Vias

Vias under the heat slug into the ground plane of the PCB are recommended for a low inductance ground connection and good thermal performance. Typical designs could use 16 vias in a 4 x 4 grid, equally spaced across the heat slug.

### 12.5 Moisture Sensitivity

XMOS devices are, like all semiconductor devices, susceptible to moisture absorption. When removed from the sealed packaging, the devices slowly absorb moisture from the surrounding environment. If the level of moisture present in the device is too high during reflow, damage can occur due to the increased internal vapour pressure of moisture. Example damage can include bond wire damage, die lifting, internal or external package cracks and/or delamination.

All XMOS devices are Moisture Sensitivity Level (MSL) 3 - devices have a shelf life of 168 hours between removal from the packaging and reflow, provided they are stored below 30C and 60% RH. If devices have exceeded these values or an included moisture indicator card shows excessive levels of moisture, then the parts should be baked as appropriate before use. This is based on information from *Joint IPC/JEDEC Standard For Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface-Mount Devices* [J-STD-020](#) Revision D.

## 14 Package Information

SYMBOL	Min.	Nom.	Max.
A	—	—	1.20
A1	0.05	—	0.15

L-17-09011	D2	4.60	4.70	4.80
	E2	4.60	4.70	4.80

NOTE :

- ① DATUM A-B AND TO DETERMINE AT DATUM PLANE H.
- ② TO BE DETERMINED AT SEATING DATUM PLAN C.
- ③ DIMENSION D1 AND E1 DO NOT INCLUDE MOLD PROTRUSIONS, ALLOWABLE PROTRUSION IS 0.25 MM PER SIDE. S1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSION INCLUDING MOLD MISMATCH.
- ④ DIMENSION B DDOE NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM B DIMENSION BY MORE THAN 0.08 mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD IS 0.07 mm FOR 0.4mm AND 0.5 mm PITCH PACKAGE.
- ⑤ THESE DIMENSIONS TO BE TO FLAT SECTION OF THE BETWEEN 0.10 mm AND 0.25 mm FROM THE LEAD TIP.
- ⑥ A1 IS THE DEFINED AS THE DISTANCE FROM THE SEATING PLAN TO THE LOWEST POINT ON TIC PACKAGE BODY.
- ⑦ PACKAGE LEAD COUNT IS NON-JEDEC STANDARD.

## Appendices

### A Configuration of the XU216-512-TQ128

The device is configured through banks of registers, as shown in Figure 33.

**Figure 33:**  
Registers

The following communication sequences specify how to access those registers. Any messages transmitted contain the most significant 24 bits of the channel-end to which a response is to be sent. This comprises the node-identifier and the channel number within the node. If no response is required on a write operation, supply 24-bits with the last 8-bits set, which suppresses the reply message. Any multi-byte data is sent most significant byte first.

#### A.1 Accessing a processor status register

The processor status registers are accessed directly from the processor instruction set. The instructions GETPS and SETPS read and write a word. The register number should be translated into a processor-status resource identifier by shifting the register number left 8 places, and ORing it with 0x0B. Alternatively, the functions `getps(reg)` and `setps(reg,value)` can be used from XC.

#### A.2 Accessing an xCORE Tile configuration register

xCORE Tile configuration registers can be accessed through the interconnect using the functions `write_tile_config_reg(tileref, ...)` and `read_tile_config_reg(tile ← ref, ...)`, where `tileref` is the name of the xCORE Tile, e.g. `tile[1]`. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the xCORE tile configuration registers. The destination of the channel-end should be set to `0xnnnnC20C` where `nnnnn` is the tile-identifier.

A write message comprises the following:

### B.5 Security configuration: 0x05

Copy of the security register as read from OTP.

**0x05:**  
Security  
configuration

Bits	Perm	Init	Description
31	RW		Disables write permission on this register
30:15	RO	-	Reserved
14	RW		Disable access to XCore's global debug
13	RO	-	Reserved
12	RW		lock all OTP sectors
11:8	RW		lock bit for each OTP sector
7	RW		Enable OTP redundancy
6	RO	-	Reserved
5	RW		Override boot mode and read boot image from OTP
4	RW		Disable JTAG access to the PLL/BOOT configuration registers
3:1	RO	-	Reserved
0	RW		Disable access to XCore's JTAG debug TAP

### B.6 Ring Oscillator Control: 0x06

There are four free-running oscillators that clock four counters. The oscillators can be started and stopped using this register. The counters should only be read when the ring oscillator has been stopped for at least 10 core clock cycles (this can be achieved by inserting two nop instructions between the SETPS and GETPS). The counter values can be read using four subsequent registers. The ring oscillators are asynchronous to the xCORE tile clock and can be used as a source of random bits.

**0x06:**  
Ring  
Oscillator  
Control

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Core ring oscillator enable.
0	RW	0	Peripheral ring oscillator enable.

### B.7 Ring Oscillator Value: 0x07

This register contains the current count of the xCORE Tile Cell ring oscillator. This value is not reset on a system reset.

### B.25 Data breakpoint control register: 0x70 .. 0x73

This set of registers controls each of the four data watchpoints.

**0x70 .. 0x73:**  
Data  
breakpoint  
control  
register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread.
15:3	RO	-	Reserved
2	DRW	0	When 1 the breakpoints will be triggered on loads.
1	DRW	0	Determines the break condition: 0 = A AND B, 1 = A OR B.
0	DRW	0	When 1 the instruction breakpoint is enabled.

### B.26 Resources breakpoint mask: 0x80 .. 0x83

This set of registers contains the mask for the four resource watchpoints.

**0x80 .. 0x83:**  
Resources  
breakpoint  
mask

Bits	Perm	Init	Description
31:0	DRW		Value.

### B.27 Resources breakpoint value: 0x90 .. 0x93

This set of registers contains the value for the four resource watchpoints.

**0x90 .. 0x93:**  
Resources  
breakpoint  
value

Bits	Perm	Init	Description
31:0	DRW		Value.

### B.28 Resources breakpoint control register: 0x9C .. 0x9F

This set of registers controls each of the four resource watchpoints.

## D.2 System switch description: 0x01

This register specifies the number of processors and links that are connected to this switch.

**0x01:**  
System  
switch  
description

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	RO		Number of SLinks on the SSwitch.
15:8	RO		Number of processors on the SSwitch.
7:0	RO		Number of processors on the device.

## D.3 Switch configuration: 0x04

This register enables the setting of two security modes (that disable updates to the PLL or any other registers) and the header-mode.

**0x04:**  
Switch  
configuration

Bits	Perm	Init	Description
31	RW	0	0 = SSCTL registers have write access. 1 = SSCTL registers can not be written to.
30:9	RO	-	Reserved
8	RW	0	0 = PLL_CTL_REG has write access. 1 = PLL_CTL_REG can not be written to.
7:1	RO	-	Reserved
0	RW	0	0 = 2-byte headers, 1 = 1-byte headers (reset as 0).

## D.4 Switch node identifier: 0x05

This register contains the node identifier.

**0x05:**  
Switch node  
identifier

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	0	The unique ID of this node.

## D.5 PLL settings: 0x06

An on-chip PLL multiplies the input clock up to a higher frequency clock, used to clock the I/O, processor, and switch, see [Oscillator](#). Note: a write to this register will cause the tile to be reset.

### D.8 System JTAG device ID register: 0x09

0x09: System JTAG device ID register	Bits	Perm	Init	Description
	31:28	RO		
	27:12	RO		
	11:1	RO		
	0	RO		

### D.9 System USERCODE register: 0x0A

0x0A: System USERCODE register	Bits	Perm	Init	Description
	31:18	RO		JTAG USERCODE value programmed into OTP SR
	17:0	RO		metal fixable ID code

### D.10 Directions 0-7: 0x0C

This register contains eight directions, for packets with a mismatch in bits 7..0 of the node-identifier. The direction in which a packet will be routed is governed by the most significant mismatching bit.

0x0C: Directions 0-7	Bits	Perm	Init	Description
	31:28	RW	0	The direction for packets whose dimension is 7.
	27:24	RW	0	The direction for packets whose dimension is 6.
	23:20	RW	0	The direction for packets whose dimension is 5.
	19:16	RW	0	The direction for packets whose dimension is 4.
	15:12	RW	0	The direction for packets whose dimension is 3.
	11:8	RW	0	The direction for packets whose dimension is 2.
	7:4	RW	0	The direction for packets whose dimension is 1.
	3:0	RW	0	The direction for packets whose dimension is 0.

### D.11 Directions 8-15: 0x0D

This register contains eight directions, for packets with a mismatch in bits 15..8 of the node-identifier. The direction in which a packet will be routed is governed by the most significant mismatching bit.

<b>0x04:</b> UIFM IFM control	Bits	Perm	Init	Description
	31:8	RO	-	Reserved
	7	RW	0	Set to 1 to enable XEVACKMODE mode.
	6	RW	0	Set to 1 to enable SOFISTOKEN mode.
	5	RW	0	Set to 1 to enable UIFM power signalling mode.
	4	RW	0	Set to 1 to enable IF timing mode.
	3	RO	-	Reserved
	2	RW	0	Set to 1 to enable UIFM linestate decoder.
	1	RW	0	Set to 1 to enable UIFM CHECKTOKENS mode.
	0	RW	0	Set to 1 to enable UIFM DOTOKENS mode.

### F.3 UIFM Device Address: 0x08

The device address whose packets should be received. 0 until enumeration, it should be set to the assigned value after enumeration.

<b>0x08:</b> UIFM Device Address	Bits	Perm	Init	Description
	31:7	RO	-	Reserved
	6:0	RW	0	The enumerated USB device address must be stored here. Only packets to this address are passed on.

### F.4 UIFM functional control: 0x0C

<b>0x0C:</b> UIFM functional control	Bits	Perm	Init	Description
	31:5	RO	-	Reserved
	4:2	RW	1	Set to 0 to disable UIFM to UTMI+ OPMODE mode.
	1	RW	1	Set to 1 to switch UIFM to UTMI+ TERMSELECT mode.
	0	RW	1	Set to 1 to switch UIFM to UTMI+ XCVRSELECT mode.

### F.5 UIFM on-the-go control: 0x10

This register is used to negotiate an on-the-go connection.

0x10: UIFM on-the-go control	Bits	Perm	Init	Description
	31:8	RO	-	Reserved
	7	RW	0	Set to 1 to switch UIFM to EXTVBUSIND mode.
	6	RW	0	Set to 1 to switch UIFM to DRVVBUSEXT mode.
	5	RO	-	Reserved
	4	RW	0	Set to 1 to switch UIFM to UTMI+ CHRGVBUS mode.
	3	RW	0	Set to 1 to switch UIFM to UTMI+ DISCHRGVBUS mode.
	2	RW	0	Set to 1 to switch UIFM to UTMI+ DMPULLDOWN mode.
	1	RW	0	Set to 1 to switch UIFM to UTMI+ DPPULLDOWN mode.
	0	RW	0	Set to 1 to switch UIFM to IDPULLUP mode.

## F.6 UIFM on-the-go flags: 0x14

Status flags used for on-the-go negotiation

0x14: UIFM on-the-go flags	Bits	Perm	Init	Description
	31:6	RO	-	Reserved
	5	RO	0	Value of UTMI+ Bvalid flag.
	4	RO	0	Value of UTMI+ IDGND flag.
	3	RO	0	Value of UTMI+ HOSTDIS flag.
	2	RO	0	Value of UTMI+ VBUSVLD flag.
	1	RO	0	Value of UTMI+ SESSVLD flag.
	0	RO	0	Value of UTMI+ SESEND flag.

**F.17 UIFM PHY control: 0x40**

Bits	Perm	Init	Description
31:19	RO	-	Reserved
18	RW	0	Set to 1 to disable pulldowns on ports 8A and 8B.
17:14	RO	-	Reserved
13	RW	0	After an auto-resume, this bit is set to indicate that the resume signalling was for reset (se0). Set to 0 to clear.
12	RW	0	After an auto-resume, this bit is set to indicate that the resume signalling was for resume (K). Set to 0 to clear.
11:8	RW	0	Log-2 number of clocks before any linestate change is propagated.
7	RW	0	Set to 1 to use the suspend controller handle to resume from suspend. Otherwise, the program has to poll the linestate_filt field in phy_teststatus.
6:4	RW	0	Control the the conf1,2,3 input pins of the PHY.
3:0	RO	-	Reserved

**0x40:**  
UIFM PHY  
control

## H.5 Boot

- ☐ The device is connected to a QSPI flash for booting, connected to X0D01, X0D04..X0D07, and X0D10 (Section 8). If not, you must boot the device through OTP or JTAG, or set it to boot from SPI and connect a SPI flash.
- ☐ The Flash that you have chosen is supported by **xflash**, or you have created a specification file for it.

## H.6 JTAG, XScope, and debugging

- ☐ You have decided as to whether you need an XSYS header or not (Section G)
- ☐ If you have not included an XSYS header, you have devised a method to program the SPI-flash or OTP (Section G).

## H.7 GPIO

- ☐ You have not mapped both inputs and outputs to the same multi-bit port.
- ☐ Pins X0D04, X0D05, X0D06, and X0D07 are output only and are, during and after reset, pulled high and low appropriately (Section 8)

## H.8 Multi device designs

Skip this section if your design only includes a single XMOS device.

- ☐ One device is connected to a QSPI or SPI flash for booting.
- ☐ Devices that boot from link have, for example, X0D06 pulled high and have link XL0 connected to a device to boot from (Section 8).
