

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

E·XFI

Product Status	Active
Core Processor	M8C
Core Size	8-Bit
Speed	12MHz
Connectivity	I ² C, SPI
Peripherals	LVD, POR, WDT
Number of I/O	24
Program Memory Size	8KB (8K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	2.4V ~ 5.25V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SSOP (0.209", 5.30mm Width)
Supplier Device Package	28-SSOP
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/cy8c20524-12pvxi

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

PSoC[®] Functional Overview

The PSoC family consists of many programmable system-on-chips with on-chip controller devices. These devices are designed to replace multiple traditional MCU based system components with one, low cost single chip programmable component. A PSoC device includes configurable analog and digital blocks, and programmable interconnect. This architecture enables the user to create customized peripheral configurations, to match the requirements of each individual application. Additionally, a fast CPU, flash program memory, SRAM data memory, and configurable I/O are included in a range of convenient pinouts.

The PSoC architecture for this device family is comprised of three main areas: core, system resources, and CapSense analog system. A common, versatile bus enables connection between I/O and the analog system. Each CY8C20x24 PSoC device includes a dedicated CapSense block that provides sensing and scanning control circuitry for capacitive sensing applications. Depending on the PSoC package, up to 28 GPIOs are also included. The GPIOs provide access to the MCU and analog mux.

PSoC Core

The PSoC core is a powerful engine that supports a rich instruction set. It encompasses SRAM for data storage, an interrupt controller, sleep and watchdog timers, and internal main oscillator (IMO) and internal low-speed oscillator (ILO). The CPU core, called the M8C, is a powerful processor with speeds up to 12 MHz. The M8C is a 2-MIPS, 8-bit Harvard-architecture microprocessor.

System resources provide additional capability, such as a configurable I^2C slave or SPI master-slave communication interface and various system resets supported by the M8C.

The analog system is composed of the CapSense PSoC block and an internal 1.8-V analog reference. Together, they support capacitive sensing of up to 28 inputs.

CapSense Analog System

The analog system contains the capacitive sensing hardware. Several hardware algorithms are supported. This hardware performs capacitive sensing and scanning without requiring external components. Capacitive sensing is configurable on each GPIO pin. Scanning of enabled CapSense pins are completed quickly and easily across multiple ports.

Analog Multiplexer System

The analog mux bus connects to every GPIO pin. Pins are connected to the bus individually or in any combination. The bus also connects to the analog system for analysis with the CapSense block comparator.

Switch control logic enables selected pins to precharge continuously under hardware control. This enables capacitive measurement for applications such as touch sensing. The analog multiplexer system in the CY8C20x24 device family is optimized for basic CapSense functionality. It supports sensing of CapSense buttons, proximity sensors, and a single slider. Other multiplexer applications include:

- Capacitive slider interface.
- Chip-wide mux that enables analog input from any I/O pin.
- Crosspoint connection between any I/O pin combinations.

When designing capacitive sensing applications, refer to the latest signal to noise signal level requirements application notes, which are found in http://www.cypress.com > Design Resources > Application Notes. In general, and unless otherwise noted in the relevant application notes, the minimum signal-to-noise ratio (SNR) requirement for CapSense applications is 5:1.

Figure 1. Analog System Block Diagram

Pinouts

This section describes, lists, and illustrates the CY8C20224, CY8C20324, CY8C20424, and CY8C20524 PSoC device pins and pinout configurations.

The CY8C20x24 PSoC device is available in a variety of packages which are listed and illustrated in the following tables. Every port pin (labeled with a "P") is capable of digital I/O and connection to the common analog bus. However, V_{SS} , V_{DD} , and XRES are not capable of Digital I/O.

16-pin Part Pinout

15	I _{OH}		P1[4]	Optional external clock input (EXTCLK)					
16	I _{OH}	I	P1[6]						
17	Input		XRES	Active high external reset with internal pull-down					

Notes

- 5. The center pad on the QFN package is connected to ground (V_{SS}) for best mechanical, thermal, and electrical performance. If not connected to ground, it is electrically floated and not connected to any other signal.
- 6. These are the ISSP pins, that are not high Z at POR (Power on reset). Refer the PSoC Programmable System-on-Chip Technical Reference Manual for details.

48-pin OCD Part Pinout

The 48-pin QFN part table and pin diagram is for the CY8C20024 On-Chip Debug (OCD) PSoC device. This part is only used for in-circuit debugging. It is NOT available for production.

Electrical Specifications

This section presents the DC and AC electrical specifications of the CY8C20224, CY8C20324, CY8C20424, and CY8C20524 PSoC devices. For the latest electrical specifications, visit the web at http://www.cypress.com/psoc.

Specifications are valid for –40 $^\circ C \le T_A \le 85$ $^\circ C$ and $T_J \le 100$ $^\circ C$ as specified, except where noted.

Refer to Table 16 on page 19 for the electrical specifications on the internal main oscillator (IMO) using SLIMO mode.

Figure 8. Voltage versus CPU Frequency and IMO Frequency Trim Options

Absolute Maximum Ratings

Table 6. Absolute Maximum Ratings

Symbol	Description	Min	Тур	Max	Units	Notes
T _{STG}	Storage temperature	-55	25	+100	°C	Higher storage temperatures reduces data retention time. Recommended storage temperature is +25 °C ± 25 °C. Extended duration storage temperatures above 65 °C degrades reliability.
T _A	Ambient temperature with power applied	-40	-	+85	°C	
V _{DD}	Supply voltage on V_{DD} relative to V_{SS}	-0.5	-	+6.0	V	
V _{IO}	DC input voltage	$V_{SS} - 0.5$	-	V _{DD} + 0.5	V	
V _{IOZ}	DC voltage applied to tri-state	$V_{SS} - 0.5$	-	V _{DD} + 0.5	V	
I _{MIO}	Maximum current into any port pin	-25	-	+50	mA	
ESD	Electrostatic discharge voltage	2000	-	-	V	Human Body Model ESD.
LU	Latch-up current	-	-	200	mA	

Operating Temperature

Table 7. Operating Temperature

Symbol	Description	Min	Тур	Мах	Units	Notes
T _A	Ambient temperature	-40	-	+85	°C	
Тյ	Junction temperature	-40	_	+100	°C	The temperature rise from ambient to junction is package specific. See Table 31 on page 30. The user must limit the power consumption to comply with this requirement.

DC Electrical Characteristics

DC Chip Level Specifications

Table 8lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and
-40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and -40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and -40 °C \leq T_A \leq 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

Table 8. DC Chip Level Specifications

Symbol	Description	Min	Тур	Max	Units	Notes
V _{DD}	Supply voltage	2.40	-	5.25	V	
I _{DD12}	Supply current, IMO = 12 MHz	-	1.5	2.5	mA	Conditions are V _{DD} = 3.0 V, T _A = 25 °C, CPU = 12 MHz.
I _{DD6}	Supply current, IMO = 6 MHz	-	1	1.5	mA	Conditions are V _{DD} = 3.0 V, T _A = 25 °C, CPU = 6 MHz.
I _{SB27}	Sleep (Mode) current with POR, LVD, sleep timer, WDT, and internal slow oscillator active. Mid temperature range.	-	2.6	4	μA	V_{DD} = 2.55 V, 0 °C \leq T _A \leq 40 °C.
I _{SB}	Sleep (Mode) current with POR, LVD, sleep timer, WDT, and internal slow oscillator active.	-	2.8	5	μA	V_{DD} = 3.3 V, -40 °C \leq T _A \leq 85 °C.

DC GPIO Specifications

Unless otherwise noted, Table 9 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and –40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and –40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and –40 °C \leq T_A \leq 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, and 2.7 V at 25 °C. These are for design guidance only.

Table 9. 5 V and 3.3 V DC GPI	O Specifications
-------------------------------	------------------

Symbol	Description	Min	Тур	Max	Units	Notes
R _{PU}	Pull-up resistor	4	5.6	8	kΩ	
V _{OH1}	High output voltage, port 0, 2, or 3 pins	V _{DD} – 0.2	-	-	V	$I_{OH} \le 10 \ \mu$ A, $V_{DD} \ge 3.0 \ V$, maximum of 20 mA source current in all I/Os.
V _{OH2}	High output voltage, port 0, 2, or 3 pins	V _{DD} – 0.9	-	-	V	I_{OH} = 1 mA, $V_{DD} \ge 3.0$ V, maximum of 20 mA source current in all I/Os.
V _{OH3}	High output voltage, port 1 pins with LDO regulator disabled	V _{DD} – 0.2	-	-	V	$I_{OH} < 10 \ \mu$ A, $V_{DD} \ge 3.0 \ V$, maximum of 10 mA source current in all I/Os.
V _{OH4}	High output voltage, port 1 pins with LDO regulator disabled	V _{DD} – 0.9	-	-	V	$I_{OH} = 5 \text{ mA}, V_{DD} \ge 3.0 \text{ V}, \text{ maximum of} 20 \text{ mA source current in all I/Os.}$
V _{OH5}	High output voltage, port 1 pins with 3.0 V LDO regulator enabled	2.7	3.0	3.3	V	$I_{OH} < 10 \ \mu$ A, $V_{DD} \ge 3.1 \ V$, maximum of 4 I/Os all sourcing 5 mA.
V _{OH6}	High output voltage, port 1 pins with 3.0 V LDO regulator enabled	2.2	-	-	V	$I_{OH} = 5 \text{ mA}, V_{DD} \ge 3.1 \text{ V}, \text{ maximum of}$ 20 mA source current in all I/Os.
V _{OH7}	High output voltage, port 1 pins with 2.4 V LDO regulator enabled	2.1	2.4	2.7	V	$I_{OH} < 10 \ \mu$ A, $V_{DD} \ge 3.0 \ V$, maximum of 20 mA source current in all I/Os.
V _{OH8}	High output voltage, port 1 pins with 2.4 V LDO regulator enabled	2.0	-	-	V	I_{OH} < 200 µA, $V_{DD} \ge$ 3.0 V, maximum of 20 mA source current in all I/Os.
V _{OH9}	High output voltage, port 1 pins with 1.8 V LDO regulator enabled	1.6	1.8	2.0	V	I_{OH} < 10 µA, 3.0 V \le V _{DD} \le 3.6 V, 0 °C \le T _A \le 85 °C, maximum of 20 mA source current in all I/Os.
V _{OH10}	High output voltage, port 1 pins with 1.8 V LDO regulator enabled	1.5	_	_	V	I_{OH} < 100 $\mu A, 3.0$ V \leq V_{DD} \leq 3.6 V, 0 $^\circ C \leq$ TA \leq 85 $^\circ C,$ maximum of 20 mA source current in all I/Os.

Table 9. 5 V and 3.3 V DC GPIO Specifications (continued)

Symbol	Description	Min	Тур	Max	Units	Notes
V _{OL}	Low output voltage	-	_	0.75	V	I_{OL} = 20 mA, V_{DD} > 3.0V, maximum of 60 mA sink current on even port pins (for example, P0[2] and P1[4]) and 60 mA sink current on odd port pins (for example, P0[3] and P1[5]).
I _{OH2}	High level source current, port 0, 2, or 3 pins	1	_	-	mA	$V_{OH} = V_{DD} - 0.9$, for the limitations of the total current and I_{OH} at other V_{OH} levels see the notes for V_{OH} .

DC Programming Specifications

Table 14 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and -40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and -40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and -40 °C \leq T_A \leq 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

Table 14. DC Programming Specifications

Symbol	Description	Min	Тур	Мах	Units	Notes
V _{DDP}	V _{DD} for programming and erase	4.5	5	5.5	V	This specification applies to the functional requirements of external programmer tools
V _{DDLV}	Low V_{DD} for verify	2.4	2.5	2.6	V	This specification applies to the functional requirements of external programmer tools
V _{DDHV}	High V _{DD} for verify	5.1	5.2	5.3	V	This specification applies to the functional requirements of external programmer tools
V _{DDIWRITE}	Supply voltage for flash write operation	2.7	_	5.25	V	This specification applies to this device when it is executing internal flash writes
I _{DDP}	Supply current during programming or verify	-	5	25	mA	
V _{ILP}	Input low voltage during programming or verify	-	-	0.8	V	
V _{IHP}	Input high voltage during programming or verify	2.2	-	-	V	
I _{ILP}	Input current when applying Vilp to P1[0] or P1[1] during programming or verify	-	_	0.2	mA	Driving internal pull-down resistor.
I _{IHP}	Input current when applying Vihp to P1[0] or P1[1] during programming or verify	-	_	1.5	mA	Driving internal pull-down resistor.
V _{OLV}	Output low voltage during programming or verify	-	-	V _{SS} + 0.75	V	
V _{OHV}	Output high voltage during programming or verify	V _{DD} – 1.0	-	V _{DD}	V	
Flash _{ENPB}	Flash endurance (per block) ^[12]	50,000	-	-	-	Erase/write cycles per block.
Flash _{ENT}	Flash endurance (total) ^[13]	1,800,000	_	-	_	Erase/write cycles.
Flash _{DR}	Flash data retention	10	-	-	Years	

DC I²C Specifications

Table 15 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and -40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and -40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and -40 °C \leq T_A \leq 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

Table 15. DC I²C Specifications^[14]

Symbol	Description	Min	Тур	Max	Units	Notes
V _{ILI2C}	Input low level	-	_	$0.3 \times V_{DD}$	V	$2.4~V \leq V_{DD} \leq 3.6~V$
		-	-	$0.25 \times V_{DD}$	V	$4.75~V \leq V_{DD} \leq 5.25~V$
V _{IHI2C}	Input high level	$0.7 \times V_{DD}$	_	_	V	$2.4~V \leq V_{DD} \leq 5.25~V$

Notes

13. A maximum of 36 × 50,000 block endurance cycles is allowed. This is balanced between operations on 36 × 1 blocks of 50,000 maximum cycles each, 36 × 2 blocks of 25,000 maximum cycles each, or 36 × 4 blocks of 12,500 maximum cycles each (to limit the total number of cycles to 36 × 50,000 and that no single block ever sees more than 50,000 cycles).

14. All GPIO meet the DC GPIO V_{IL} and V_{IH} specifications found in the DC GPIO Specifications sections. The I^2 C GPIO pins also meet the above specs.

^{12.} The 50,000 cycle flash endurance per block will only be guaranteed if the flash is operating within one voltage range. Voltage ranges are 2.4 V to 3.0 V, 3.0 V to 3.6 V and 4.75 V to 5.25 V.

AC Electrical Characteristics

AC Chip Level Specifications

Table 16 and Table 17 list the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and –40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and –40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and –40 °C \leq T_A \leq 85 °C respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

Table 16. 5 V and 3.3 V AC Chip-Level Specifications

Symbol	Description	Min	Тур	Max	Units	Notes
F _{CPU1}	CPU frequency (3.3 V nominal)	0.75	-	12.6	MHz	12 MHz only for SLIMO Mode = 0
F _{32K1}	ILO frequency	15	32	64	kHz	
F _{32K_U}	ILO untrimmed frequency	5	_	100	kHz	After a reset and before the M8C starts to run, the ILO is not trimmed. See the System Resets section of the PSoC Technical Reference Manual for details on this timing.
F _{IMO12}	IMO stability for 12 MHz (Commercial temperature) ^[15]	11.4	12	12.6	MHz	Trimmed for 3.3 V operation using factory trim values. See Figure 8 on page 14, SLIMO Mode = 0.
F _{IMO6}	IMO stability for 6 MHz (Commercial temperature)	5.5	6.0	6.5	MHz	Trimmed for 3.3 V operation using factory trim values. See Figure 8 on page 14, SLIMO Mode = 1.
DCIMO	Duty cycle of IMO	40	50	60	%	
DC _{ILO}	ILO duty cycle	20	50	80	%	
t _{RAMP}	Supply ramp time	0	-	-	μs	
t _{XRST}	External reset pulse width	10	-	-	μs	
t _{POWERUP}	Time from end of POR to CPU executing code	-	16	100	ms	Power up from 0 V. See the System Resets section of the PSoC Technical Reference Manual.
t _{jit_IMO} ^[16]	12 MHz IMO cycle-to-cycle jitter (RMS)	-	200	1600	ps	
	12 MHz IMO long term N cycle-to-cycle jitter (RMS)	-	600	1400	ps	N = 32
	12 MHz IMO period jitter (RMS)	_	100	900	ps	

Notes 15.0 °C to 70 °C ambient, V_{DD} = 3.3 V. 16. Refer to Cypress Jitter Specifications application note, Understanding Datasheet Jitter Specifications for Cypress Timing Products - AN5054 for more information.

AC GPIO Specifications

Table 18 and Table 19 list the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25V and -40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and -40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and -40 °C \leq T_A \leq 85 °C respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

Table 18. 5 V and 3.3 V AC GPIO Specifications

Symbol	Description	Min	Тур	Max	Units	Notes
F _{GPIO}	GPIO operating frequency	0	-	6	MHz	Normal strong mode, Port 1.
t _{Rise023}	Rise time, strong mode, Cload = 50 pF, ports 0, 2, 3	15	-	80	ns	V _{DD} = 3.0 V to 3.6 V and 4.75 V to 5.25 V, 10% to 90%
t _{Rise1}	Rise time, strong mode, Cload = 50 pF, port 1	10	-	50	ns	V _{DD} = 3.0 V to 3.6 V, 10% to 90%
t _{Fall}	Fall time, strong mode, Cload = 50 pF, all ports	10	-	50	ns	V _{DD} = 3.0 V to 3.6 V and 4.75 V to 5.25 V, 10% to 90%

Table 19. 2.7 V AC GPIO Specifications

Symbol	Description	Min	Тур	Max	Units	Notes
F _{GPIO}	GPIO operating frequency	0	-	1.5	MHz	Normal Strong Mode, Port 1.
t _{Rise023}	Rise time, strong mode, Cload = 50 pF, ports 0, 2, 3	15	-	100	ns	V _{DD} = 2.4 V to 3.0 V, 10% to 90%
t _{Rise1}	Rise time, strong mode, Cload = 50 pF, port 1	10	-	70	ns	V _{DD} = 2.4 V to 3.0 V, 10% to 90%
t _{Fall}	Fall time, strong mode, Cload = 50 pF, all ports	10	-	70	ns	V _{DD} = 2.4 V to 3.0 V, 10% to 90%

Figure 9. GPIO Timing Diagram

AC Comparator Specifications

Table 20 lists the guaranteed maximum and minimum specifications for the voltage and temperature ranges: 4.75 V to 5.25 V and -40 °C \leq T_A \leq 85 °C, 3.0 V to 3.6 V and -40 °C \leq T_A \leq 85 °C, or 2.4 V to 3.0 V and -40 °C \leq T_A \leq 85 °C, respectively. Typical parameters apply to 5 V, 3.3 V, or 2.7 V at 25 °C. These are for design guidance only.

 Table 20. AC Comparator Specifications

Symbol	Description	Min	Тур	Мах	Units	Notes
t _{COMP}	Comparator response time, 50 mV overdrive	I	_	100 200	ns ns	V _{DD} ≥ 3.0 V 2.4 V < V _{CC} < 3.0 V

Figure 10. Definition for Timing for Fast or Standard Mode on the I²C Bus

AC SPI Specifications

Table 28. SPI Master AC Specifications

Symbol	Description	Conditions	Min	Тур	Max	Units
F _{SCLK}	SCLK clock frequency		-	_	12	MHz
DC	SCLK duty cycle		-	50	-	%
t _{SETUP}	MISO to SCLK setup time		40	_	-	ns
t _{HOLD}	SCLK to MISO hold time		40	_	-	ns
t _{OUT_VAL}	SCLK to MOSI valid time		-	_	40	ns
t _{о∪т_н}	MOSI high time		40	_	-	ns

Table 29. SPI Slave AC Specifications

Symbol	Description	Conditions	Min	Тур	Мах	Units
F _{SCLK}	SCLK clock frequency		-	-	4	MHz
t _{LOW}	SCLK low time		41.67	-	-	ns
t _{HIGH}	SCLK high time		41.67	-	-	ns
t _{SETUP}	MOSI to SCLK setup time		30	-	-	ns
t _{HOLD}	SCLK to MOSI hold time		50	-	-	ns
t _{SS_MISO}	SS high to MISO valid		-	-	153	ns
t _{SCLK_MISO}	SCLK to MISO valid		-	-	125	ns
t _{SS_HIGH}	SS high time		-	-	50	ns
t _{SS_CLK}	Time from SS low to first SCLK		2/SCLK	-	-	ns
t _{CLK_SS}	Time from last SCLK to SS high		2/SCLK	-	-	ns

Ordering Information

Table 30 lists the CY8C20224, CY8C20324, CY8C20424, and CY8C20524 PSoC devices key package features and ordering codes.

Table 30.	PSoC Device Ke	v Features and	d Orderina	Information
	I GOO DEVICE INC	y i culuico un	a oracring	mormanon

Package	Ordering Code	Flash (Bytes)	SRAM (Bytes)	Maximum Number of Buttons	Maximum Number of Sliders	Maximum Number of LEDs	Configurable LED Behavior (Fade, Strobe)	Proximity Sensing
16-pin (3 × 3 mm 0.60 Max) COL	CY8C20224-12LKXI	8 K	512	10	1	13	Yes	Yes
16-pin (3 × 3 mm 0.60 Max) COL (Tape and Reel)	CY8C20224-12LKXIT	8 K	512	10	1	13	Yes	Yes
24-pin (4 × 4 mm 0.60 Max) QFN	CY8C20324-12LQXI	8 K	512	17	1	20	Yes	Yes
24-pin (4 × 4 mm 0.60 Max) QFN (Tape and Reel)	CY8C20324-12LQXIT	8 K	512	17	1	20	Yes	Yes
28-pin (210-Mil) SSOP	CY8C20524-12PVXI	8 K	512	21	1	24	Yes	Yes
28-pin (210-Mil) SSOP (Tape and Reel)	CY8C20524-12PVXIT	8 K	512	21	1	24	Yes	Yes
32-pin (5 × 5 mm 0.60 Max) QFN (Sawn)	CY8C20424-12LQXI	8 K	512	25	1	28	Yes	Yes
32-pin (5 × 5 mm 0.60 Max) QFN (Sawn)	CY8C20424-12LQXIT	8 K	512	25	1	28	Yes	Yes

Note For Die sales information, contact a local Cypress sales office or Field Applications Engineer (FAE).

Ordering Code Definitions

Figure 14. 32-pin QFN (5 × 5 × 0.55 mm) 1.3 × 2.7 E-Pad (Sawn Type) Package Outline, 001-48913 TOP VIEW SIDE VIEW BOTTOM VIEW

Figure 15. 48-pin QFN (7 × 7 × 1.0 mm) 5.1 × 5.1 E-Pad (Subcon Punch Type Package) Package Outline, 001-12919

Important For information on the preferred dimensions for mounting the QFN packages, see the following application note at http://www.amkor.com/products/notes_papers/MLFAppNote.pdf.

It is important to note that pinned vias for thermal conduction are not required for the low power 24, 32, and 48-pin QFN PSoC devices.

Thermal Impedances

Table 31. Thermal Impedances Per Package

Package	Typical θ _{JA} ^[20]
16-pin COL	46 °C/W
24-pin QFN ^[21]	25 °C/W
28-pin SSOP	96 °C/W
32-pin QFN ^[21]	27 °C/W
48-pin QFN ^[21]	28 °C/W

Solder Reflow Specifications

Table 32 lists the minimum solder reflow peak temperature to achieve good solderability.

Table 32. Solder Reflow Specifications

Package	Maximum Peak Temperature	Time at Maximum Peak Temperature
16-pin COL	260 °C	30 s
24-pin QFN	260 °C	30 s
28-pin SSOP	260 °C	30 s
32-pin QFN	260 °C	30 s
48-pin QFN	260 °C	30 s

Document Conventions

Units of Measure

Table 35 lists the units of measures.

Table 35. Units of Measure

Symbol	Unit of Measure	Symbol	Unit of Measure
°C	degree Celsius	ms	millisecond
pF	picofarad	ns	nanosecond
kHz	kilohertz	ps	picosecond
MHz	megahertz	μV	microvolts
kΩ	kilohm	mV	millivolts
Ω	ohm	V	volts
μA	microampere	W	watt
mA	milliampere	mm	millimeter
nA	nanoampere	%	percent
μs	microsecond		

Numeric Conventions

Hexadecimal numbers are represented with all letters in uppercase with an appended lowercase 'h' (for example, '14h' or '3Ah'). Hexadecimal numbers may also be represented by a '0x' prefix, the C coding convention. Binary numbers have an appended lowercase 'b' (for example, 01010100b' or '01000011b'). Numbers not indicated by an 'h' or 'b' are decimals.

Glossary

active high	 A logic signal having its asserted state as the logic 1 state. A logic signal having the logic 1 state as the higher voltage of the two states. 				
analog blocks	The basic programmable opamp circuits. These are SC (switched capacitor) and CT (continuous time) blocks. These blocks can be interconnected to provide ADCs, DACs, multi-pole filters, gain stages, and much more.				
analog-to-digital (ADC)	A device that changes an analog signal to a digital signal of corresponding magnitude. Typically, an ADC converts a voltage to a digital number. The digital-to-analog (DAC) converter performs the reverse operation.				
Application programming interface (API)	A series of software routines that comprise an interface between a computer application and lower level services and functions (for example, user modules and libraries). APIs serve as building blocks for programmers that create software applications.				
asynchronous	A signal whose data is acknowledged or acted upon immediately, irrespective of any clock signal.				
Bandgap reference	A stable voltage reference design that matches the positive temperature coefficient of VT with the negative temperature coefficient of VBE, to produce a zero temperature coefficient (ideally) reference.				
bandwidth	 The frequency range of a message or information processing system measured in hertz. The width of the spectral region over which an amplifier (or absorber) has substantial gain (or loss); it is sometimes represented more specifically as, for example, full width at half maximum. 				
bias	 A systematic deviation of a value from a reference value. The amount by which the average of a set of values departs from a reference value. The electrical, mechanical, magnetic, or other force (field) applied to a device to establish a reference level to operate the device. 				

Glossary (continued)

External Reset (XRES)	An active high signal that is driven into the PSoC device. It causes all operation of the CPU and blocks to stop and return to a pre-defined state.			
Flash	An electrically programmable and erasable, non-volatile technology that provides you the programmability and data storage of EPROMs, plus in-system erasability. Non-volatile means that the data is retained when power is OFF.			
Flash block	The smallest amount of Flash ROM space that may be programmed at one time and the smallest amount of Flash space that may be protected. A Flash block holds 64 bytes.			
frequency	The number of cycles or events per unit of time, for a periodic function.			
gain	The ratio of output current, voltage, or power to input current, voltage, or power, respectively. Gain is usually expressed in dB.			
I ² C	A two-wire serial computer bus by Philips Semiconductors (now NXP Semiconductors). I2C is an Inter-Integrated Circuit. It is used to connect low-speed peripherals in an embedded system. The original system was created in the early 1980s as a battery control interface, but it was later used as a simple internal bus system for building control electronics. I2C uses only two bi-directional pins, clock and data, both running at +5V and pulled high with resistors. The bus operates at 100 kbits/second in standard mode and 400 kbits/second in fast mode.			
ICE	The in-circuit emulator that allows you to test the project in a hardware environment, while viewing the debugging device activity in a software environment (PSoC Designer).			
input/output (I/O)	A device that introduces data into or extracts data from a system.			
interrupt	A suspension of a process, such as the execution of a computer program, caused by an event external to that process, and performed in such a way that the process can be resumed.			
interrupt service routine (ISR)	A block of code that normal code execution is diverted to when the M8C receives a hardware interrupt. Many interrupt sources may each exist with its own priority and individual ISR code block. Each ISR code block ends with the RETI instruction, returning the device to the point in the program where it left normal program execution.			
jitter	1. A misplacement of the timing of a transition from its ideal position. A typical form of corruption that occurs on serial data streams.			
	The abrupt and unwanted variations of one or more signal characteristics, such as the interval between successive pulses, the amplitude of successive cycles, or the frequency or phase of successive cycles.			
low-voltage detect (LVD)	A circuit that senses V_{DD} and provides an interrupt to the system when V_{DD} falls lower than a selected threshold.			
M8C	An 8-bit Harvard-architecture microprocessor. The microprocessor coordinates all activity inside a PSoC by interfacing to the Flash, SRAM, and register space.			
master device	A device that controls the timing for data exchanges between two devices. Or when devices are cascaded in width, the master device is the one that controls the timing for data exchanges between the cascaded devices and an external interface. The controlled device is called the <i>slave device</i> .			
microcontroller	An integrated circuit chip that is designed primarily for control systems and products. In addition to a CPU, a microcontroller typically includes memory, timing circuits, and I/O circuitry. The reason for this is to permit the realization of a controller with a minimal quantity of chips, thus achieving maximal possible miniaturization. This in turn, reduces the volume and the cost of the controller. The microcontroller is normally not used for general-purpose computation as is a microprocessor.			
mixed-signal	The reference to a circuit containing both analog and digital techniques and components.			

Glossary (continued)

modulator	A device that imposes a signal on a carrier.
noise	 A disturbance that affects a signal and that may distort the information carried by the signal. The random variations of one or more characteristics of any entity such as voltage, current, or data.
oscillator	A circuit that may be crystal controlled and is used to generate a clock frequency.
parity	A technique for testing transmitting data. Typically, a binary digit is added to the data to make the sum of all the digits of the binary data either always even (even parity) or always odd (odd parity).
Phase-locked loop (PLL)	An electronic circuit that controls an oscillator so that it maintains a constant phase angle relative to a reference signal.
pinouts	The pin number assignment: the relation between the logical inputs and outputs of the PSoC device and their physical counterparts in the printed circuit board (PCB) package. Pinouts involve pin numbers as a link between schematic and PCB design (both being computer generated files) and may also involve pin names.
port	A group of pins, usually eight.
Power on reset (POR)	A circuit that forces the PSoC device to reset when the voltage is lower than a pre-set level. This is a type of hardware reset.
PSoC [®]	Cypress Semiconductor's PSoC [®] is a registered trademark and Programmable System-on-Chip™ is a trademark of Cypress.
PSoC Designer™	The software for Cypress' Programmable System-on-Chip technology.
pulse width modulator (PWM)	An output in the form of duty cycle which varies as a function of the applied measurand
RAM	An acronym for random access memory. A data-storage device from which data can be read out and new data can be written in.
register	A storage device with a specific capacity, such as a bit or byte.
reset	A means of bringing a system back to a know state. See hardware reset and software reset.
ROM	An acronym for read only memory. A data-storage device from which data can be read out, but new data cannot be written in.
serial	 Pertaining to a process in which all events occur one after the other. Pertaining to the sequential or consecutive occurrence of two or more related activities in a single device or channel.
settling time	The time it takes for an output signal or value to stabilize after the input has changed from one value to another.
shift register	A memory storage device that sequentially shifts a word either left or right to output a stream of serial data.
slave device	A device that allows another device to control the timing for data exchanges between two devices. Or when devices are cascaded in width, the slave device is the one that allows another device to control the timing of data exchanges between the cascaded devices and an external interface. The controlling device is called the master device.

Glossary (continued)

SRAM	An acronym for static random access memory. A memory device where you can store and retrieve data at a high rate of speed. The term static is used because, after a value is loaded into an SRAM cell, it remains unchanged until it is explicitly altered or until power is removed from the device.
SROM	An acronym for supervisory read only memory. The SROM holds code that is used to boot the device, calibrate circuitry, and perform Flash operations. The functions of the SROM may be accessed in normal user code, operating from Flash.
stop bit	A signal following a character or block that prepares the receiving device to receive the next character or block.
synchronous	 A signal whose data is not acknowledged or acted upon until the next active edge of a clock signal. A system whose operation is synchronized by a clock signal.
tri-state	A function whose output can adopt three states: 0, 1, and Z (high-impedance). The function does not drive any value in the Z state and, in many respects, may be considered to be disconnected from the rest of the circuit, allowing another output to drive the same net.
UART	A UART or universal asynchronous receiver-transmitter translates between parallel bits of data and serial bits.
user modules	Pre-build, pre-tested hardware/firmware peripheral functions that take care of managing and configuring the lower level Analog and Digital PSoC Blocks. User Modules also provide high level API (Application Programming Interface) for the peripheral function.
user space	The bank 0 space of the register map. The registers in this bank are more likely to be modified during normal program execution and not just during initialization. Registers in bank 1 are most likely to be modified only during the initialization phase of the program.
V _{DD}	A name for a power net meaning "voltage drain." The most positive power supply signal. Usually 5 V or 3.3 V.
V _{SS}	A name for a power net meaning "voltage source." The most negative power supply signal.
watchdog timer	A timer that must be serviced periodically. If it is not serviced, the CPU resets after a specified period of time.
