Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Table 2 lists recommended operational voltage conditions.

Table 2. Recommended Operating Conditions[1]

Rating	Symbol	2.5-V Device[2]	Unit
Core supply voltage	VDD	2.4–2.7	V
PLL supply voltage	VCCSYN	2.4–2.7	V
I/O supply voltage	VDDH	3.135 – 3.465	V
Input voltage	VIN	GND (-0.3) – 3.465	V
Junction temperature (maximum)	T_j	105	°C

1 **Caution:** These are the recommended and tested operating conditions. Proper device operating outside of these conditions is not guaranteed.
2 Parts labeled with an "-HVA" suffix are 2.6-V devices.

NOTE: Core, PLL, and I/O Supply Voltages

VDDH, VCCSYN, and VDD must track each other and both must vary in the same direction—in the positive direction (+5% and +0.1 Vdc) or in the negative direction (–5% and –0.1 Vdc).

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

Figure 2 shows the undershoot and overshoot voltage of the 60x and local bus memory interface of the MPC8280. Note that in PCI mode the I/O interface is different.

2.3.1 Layout Practices

Each V_{CC} pin should be provided with a low-impedance path to the board's power supply. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The V_{CC} power supply should be bypassed to ground using at least four 0.1 µF by-pass capacitors located as close as possible to the four sides of the package. The capacitor leads and associated printed circuit traces connecting to chip V_{CC} and ground should be kept to less than half an inch per capacitor lead. A four-layer board is recommended, employing two inner layers as V_{CC} and GND planes.

All output pins on the MPC8260 have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized in order to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the V_{CC} and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

Table 5 provides preliminary, estimated power dissipation for various configurations. Note that suitable thermal management is required for conditions above P_D = 3W (when the ambient temperature is 70° C or greater) to ensure the junction temperature does not exceed the maximum specified value. Also note that the I/O power should be included when determining whether to use a heat sink.

2.4 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for the 66 MHz MPC8260 device. Note that AC timings are based on a 50-p*f* load. Typical output buffer impedances are shown in Table 6.

Table 6. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	40
Local bus	40
Memory controller	40
Parallel I/O	46

Note:

[1] These are typical values at 65° C. The impedance may vary by ±25% with process and temperature.

Table 7 lists CPM output characteristics.

Table 7. AC Characteristics for CPM Outputs[1]

sp38b	sp39b	Ex_SCC/SMC/SPI/I2C outputs—external clock (NMSI)	19	2
sp42	sp43	PIO/TIMER/IDMA outputs	14	1

Note:

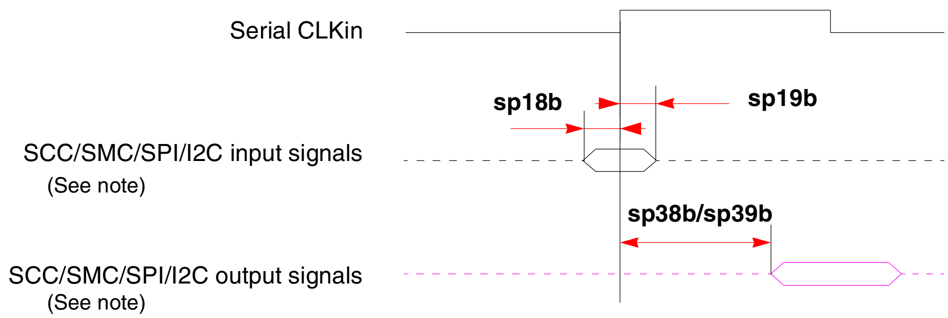
[1] Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

Table 8 lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

Figure 5 shows the SCC/SMC/SPI/I^{2}C external clock.



Note: There are four possible timing conditions for SCC and SPI:
1. Input sampled on the rising edge and output driven on the rising edge (shown).
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge.
4. Input sampled on the falling edge and output driven on the rising edge.

NOTE

Generally, all MPC8260 bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 11.

Table 11. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin

[1] Because of speed dependencies, not all of the possible configurations in Table 13 are applicable.
[2] The user should choose the input clock frequency and the multiplication factors such that the frequency of the CPU ranges between 133–200 and the CPM ranges between 50–166 MHz.
[3] Input clock frequency is given only for the purpose of reference. User should set MODCK_H–MODCK_L so that the resulting configuration does not exceed the frequency rating of the user's part.

Table 15. Symbol Legend (continued)

Symbol	Meaning
UTS	Indicates that a signal is part of the UTOPIA slave interface
UT8	Indicates that a signal is part of the 8-bit UTOPIA interface
UT16	Indicates that a signal is part of the 16-bit UTOPIA interface
MII	Indicates that a signal is part of the media independent interface

5 Package Description

The following sections provide the package parameters and mechanical dimensions for the MPC8260.

5.1 Package Parameters

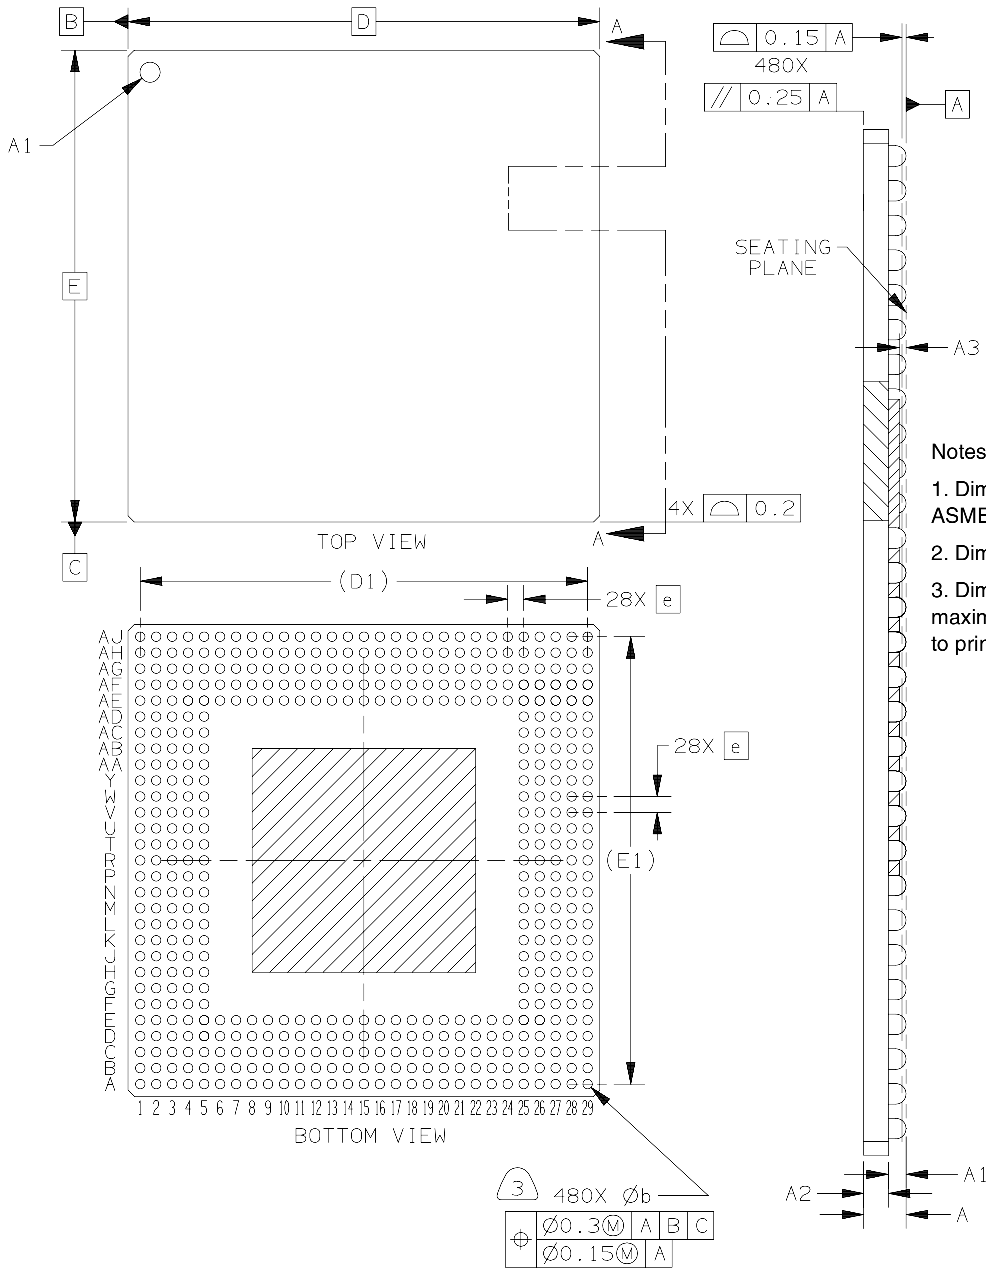
Package parameters are provided in Table 16. The package type is a 37.5 × 37.5 mm, 480-lead TBGA.

Table 16. Package Parameters

Parameter	Value
Package Outline	37.5 x 37.5 mm
Interconnects	480 (29 x 29 ball array)
Pitch	1.27 mm
Nominal unmounted package height	1.55 mm

5.2 Mechanical Dimensions

Figure 15 provides the mechanical dimensions and bottom surface nomenclature of the 480 TBGA package.



Notes:

1. Dimensions and Tolerancing per ASME Y14.5M-1994.
2. Dimensions in millimeters.
3. Dimension b is measured at the maximum solder ball diameter, parallel to primary data A.

Dim	Millimeters	
	Min	Max
A	1.45	1.65
A1	0.60	0.70
A2	0.85	0.95
A3	0.25	—
b	0.65	0.85
D	37.50 BSC	
D1	35.56 REF	
e	1.27 BSC	
E	37.50 BSC	
E1	35.56 REF
