
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	XCore
Core Size	32-Bit 24-Core
Speed	4000MIPS
Connectivity	-
Peripherals	-
Number of I/O	176
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	1M x 8
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	374-LFBGA
Supplier Device Package	374-FBGA (18x18)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xl232-1024-fb374-c40

1 xCORE Multicore Microcontrollers

The xCORE200 Series is a comprehensive range of 32-bit multicore microcontrollers that brings the low latency and timing determinism of the xCORE architecture to mainstream embedded applications. Unlike conventional microcontrollers, xCORE multicore microcontrollers execute multiple real-time tasks simultaneously and communicate between tasks using a high speed network. Because xCORE multicore microcontrollers are completely deterministic, you can write software to implement functions that traditionally require dedicated hardware.

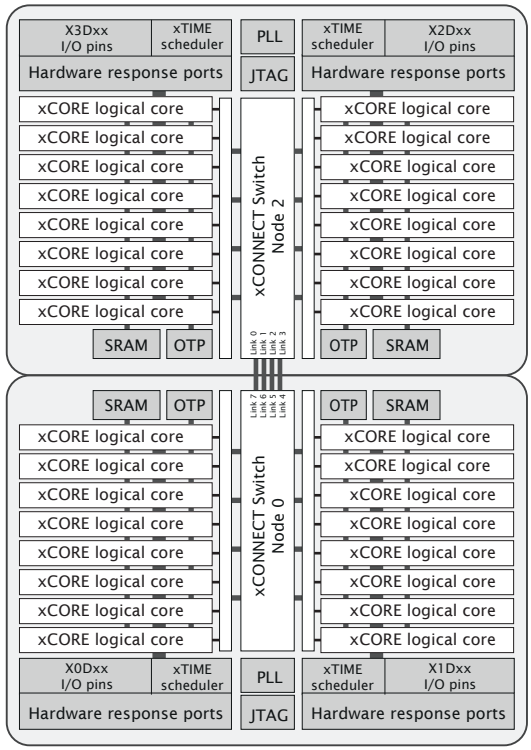

Figure 1: XL232-1024-FB374 block diagram

Key features of the XL232-1024-FB374 include:

- **Tiles**: Devices consist of one or more xCORE tiles. Each tile contains between five and eight 32-bit xCOREs with highly integrated I/O and on-chip memory.
- **Logical cores** Each logical core can execute tasks such as computational code, DSP code, control software (including logic decisions and executing a state machine) or software that handles I/O. Section 6.1
- **xTIME scheduler** The xTIME scheduler performs functions similar to an RTOS, in hardware. It services and synchronizes events in a core, so there is no requirement for interrupt handler routines. The xTIME scheduler triggers cores

on events generated by hardware resources such as the I/O pins, communication channels and timers. Once triggered, a core runs independently and concurrently to other cores, until it pauses to wait for more events. Section 6.2

- **Channels and channel ends** Tasks running on logical cores communicate using channels formed between two channel ends. Data can be passed synchronously or asynchronously between the channel ends assigned to the communicating tasks. Section 6.5
- **xCONNECT Switch and Links** Between tiles, channel communications are implemented over a high performance network of xCONNECT Links and routed through a hardware xCONNECT Switch. Section 6.6
- **Ports** The I/O pins are connected to the processing cores by Hardware Response ports. The port logic can drive its pins high and low, or it can sample the value on its pins optionally waiting for a particular condition. Section 6.3
- **Clock blocks** xCORE devices include a set of programmable clock blocks that can be used to govern the rate at which ports execute. Section 6.4
- **Memory** Each xCORE Tile integrates a bank of SRAM for instructions and data, and a block of one-time programmable (OTP) memory that can be configured for system wide security features. Section 9
- **PLL** The PLL is used to create a high-speed processor clock given a low speed external oscillator. Section 7
- **JTAG** The JTAG module can be used for loading programs, boundary scan testing, in-circuit source-level debugging and programming the OTP memory. Section 10

1.1 Software

Devices are programmed using C, C++ or xC (C with multicore extensions). XMOS provides tested and proven software libraries, which allow you to quickly add interface and processor functionality such as USB, Ethernet, PWM, graphics driver, and audio EQ to your applications.

1.2 xTIMEcomposer Studio

The xTIMEcomposer Studio development environment provides all the tools you need to write and debug your programs, profile your application, and write images into flash memory or OTP memory on the device. Because xCORE devices operate deterministically, they can be simulated like hardware within xTIMEcomposer: uniquely in the embedded world, xTIMEcomposer Studio therefore includes a static timing analyzer, cycle-accurate simulator, and high-speed in-circuit instrumentation.

xTIMEcomposer can be driven from either a graphical development environment, or the command line. The tools are supported on Windows, Linux and MacOS X and available at no cost from xmos.com/downloads. Information on using the tools is provided in the xTIMEcomposer User Guide, X3766.

2 XL232-1024-FB374 Features

- **Multicore Microcontroller with Advanced Multi-Core RISC Architecture**
  - 32 real-time logical cores on 4 xCORE tiles
  - Cores share up to 2000 MIPS
    - Up to 4000 MIPS in dual issue mode
  - Each logical core has:
    - Guaranteed throughput of between 1/5 and 1/8 of tile MIPS
    - 16x32bit dedicated registers
  - 167 high-density 16/32-bit instructions
    - All have single clock-cycle execution (except for divide)
    - 32x32→64-bit MAC instructions for DSP, arithmetic and user-definable cryptographic functions
- **Programmable I/O**
  - 256 general-purpose I/O pins, configurable as input or output
    - Up to 56 x 1bit port, 22 x 4bit port, 13 x 8bit port, 6 x 16bit port, 4 x 32bit port
    - 8 xCONNECT links
  - Port sampling rates of up to 60 MHz with respect to an external clock
  - 128 channel ends (32 per tile) for communication with other cores, on or off-chip
- **Memory**
  - 1024KB internal single-cycle SRAM (max 256KB per tile) for code and data storage
  - 32KB internal OTP (max 8KB per tile) for application boot code
- **Hardware resources**
  - 24 clock blocks (6 per tile)
  - 40 timers (10 per tile)
  - 16 locks (4 per tile)
- **JTAG Module for On-Chip Debug**
- **Security Features**
  - Programming lock disables debug and prevents read-back of memory contents
  - AES bootloader ensures secrecy of IP held on external flash memory
- **Ambient Temperature Range**
  - Commercial qualification: 0°C to 70°C
  - Industrial qualification: -40°C to 85°C
- **Speed Grade**
  - 40: 2000 MIPS
- **Power Consumption**
  - 1140 mA (typical)
- **374-pin FBGA package 0.8 mm pitch**

5 Example Application Diagram

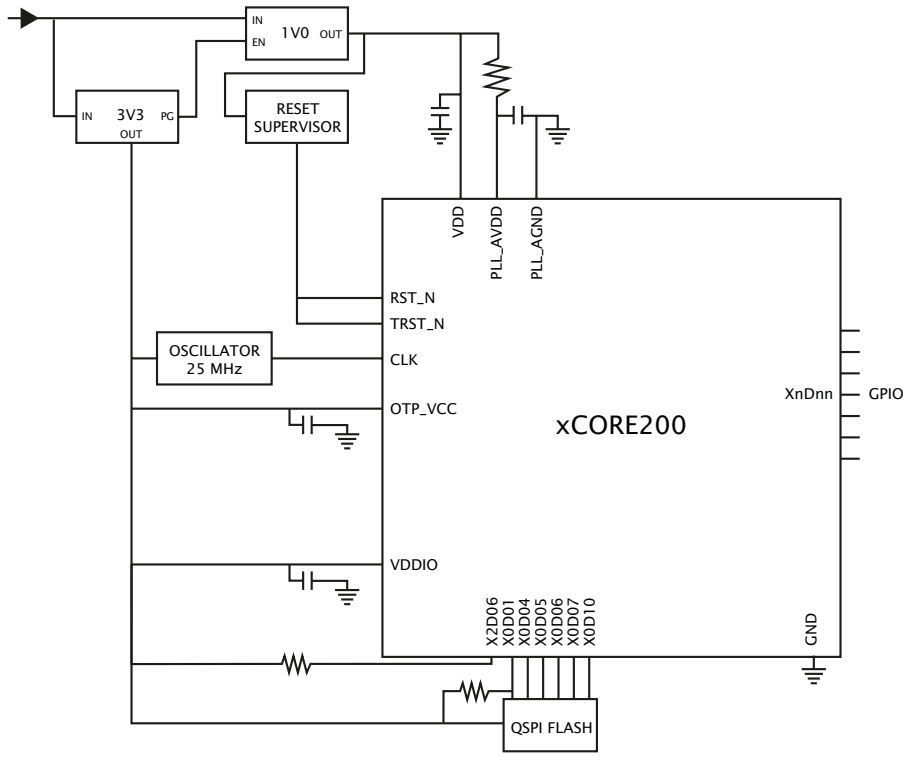

Figure 2: Simplified Reference Schematic

- see Section 11 for details on the power supplies and PCB design

6 Product Overview

The XL232-1024-FB374 is a powerful device that consists of four xCORE Tiles, each comprising a flexible logical processing cores with tightly integrated I/O and on-chip memory.

6.1 Logical cores

Each tile has 8 active logical cores, which issue instructions down a shared five-stage pipeline. Instructions from the active cores are issued round-robin. If up to five logical cores are active, each core is allocated a fifth of the processing cycles. If more than five logical cores are active, each core is allocated at least $1/n$ cycles (for n cores). Figure 3 shows the guaranteed core performance depending on the number of cores used.

Figure 3: Logical core performance

Speed grade	MIPS	Frequency	Minimum MIPS per core (for *n* cores)							
			1	2	3	4	5	6	7	8
20	2000 MIPS	500 MHz	100	100	100	100	100	83	71	63

There is no way that the performance of a logical core can be reduced below these predicted levels (unless *priority threads* are used: in this case the guaranteed minimum performance is computed based on the number of priority threads as defined in the architecture manual). Because cores may be delayed on I/O, however, their unused processing cycles can be taken by other cores. This means that for more than five logical cores, the performance of each core is often higher than the predicted minimum but cannot be guaranteed.

The logical cores are triggered by events instead of interrupts and run to completion. A logical core can be paused to wait for an event.

6.2 xTIME scheduler

The xTIME scheduler handles the events generated by xCORE Tile resources, such as channel ends, timers and I/O pins. It ensures that all events are serviced and synchronized, without the need for an RTOS. Events that occur at the I/O pins are handled by the Hardware-Response ports and fed directly to the appropriate xCORE Tile. An xCORE Tile can also choose to wait for a specified time to elapse, or for data to become available on a channel.

Tasks do not need to be prioritised as each of them runs on their own logical xCORE. It is possible to share a set of low priority tasks on a single core using cooperative multitasking.

6.3 Hardware Response Ports

Hardware Response ports connect an xCORE tile to one or more physical pins and as such define the interface between hardware attached to the XL232-1024-FB374, and the software running on it. A combination of 1bit, 4bit, 8bit, 16bit and 32bit

Figure 7 also lists the values of OD, F and R, which are the registers that define the ratio of the tile frequency to the oscillator frequency:

$$F_{core} = F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \times \frac{1}{OD+1}$$

OD, F and R must be chosen so that $0 \leq R \leq 63$, $0 \leq F \leq 4095$, $0 \leq OD \leq 7$, and $260MHz \leq F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \leq 1.3GHz$. The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

The MODE pins must be held at a static value during and after deassertion of the system reset.

If a different tile frequency is required (eg, 500 MHz), then the PLL must be reprogrammed after boot to provide the required tile frequency. The XMOS tools perform this operation by default. Further details on configuring the clock can be found in the xCORE-200 Clock Frequency Control document.

8 Boot Procedure

The device is kept in reset by driving RST_N low. When in reset, all GPIO pins have a pull-down enabled. When the device is taken out of reset by releasing RST_N the processor starts its internal reset process. After 15-150 μs (depending on the input clock) the processor boots.

Pin X2D06 must be pulled high with an external pull-up whilst the chip comes out of reset, to ensure that tile 2 will boot from link. X2D04, X2D05, and X2D07 should be kept low whilst the chip comes out of reset.

The xCORE Tile boot procedure is illustrated in Figure 8. If bit 5 of the security register (*see* §9.1) is set, the device boots from OTP. To get a high value, a 3K3 pull-up resistor should be strapped onto the pin. To assure a low value, a pull-down resistor is required if other external devices are connected to this port.

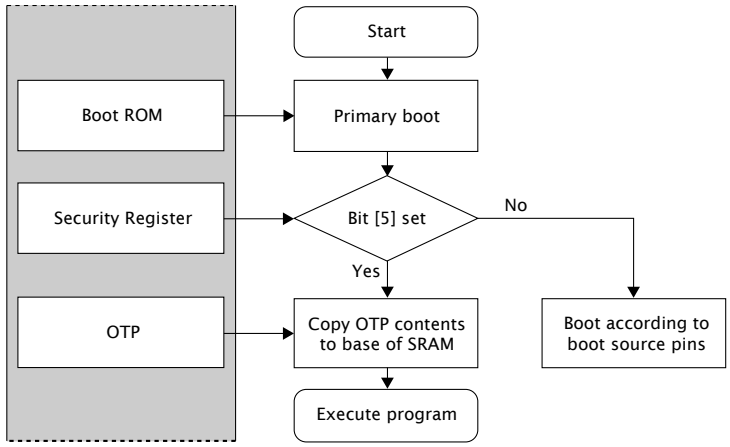

Figure 8: Boot procedure

X0D06	X0D05	X0D04	Tile 0 boot	Tile 1 boot	Enabled links
0	0	0	QSPI master	Channel end 0	None
0	0	1	SPI master	Channel end 0	None
0	1	0	SPI slave	Channel end 0	None
0	1	1	SPI slave	SPI slave	None
1	0	0	Channel end 0	Channel end 0	XL0 (2w)
1	0	1	Channel end 0	Channel end 0	XL4-XL7 (5w)
1	1	0	Channel end 0	Channel end 0	XL1, XL2, XL5, and XL6 (5w)
1	1	1	Channel end 0	Channel end 0	XL0-XL3 (5w)

Figure 9: Boot source pins

The boot image has the following format:

- A 32-bit program size s in words.
- Program consisting of $s \times 4$ bytes.
- A 32-bit CRC, or the value 0x0D15AB1E to indicate that no CRC check should be performed.

The program size and CRC are stored least significant byte first. The program is loaded into the lowest memory address of RAM, and the program is started from that address. The CRC is calculated over the byte stream represented by the program size and the program itself. The polynomial used is 0xEDB88320 (IEEE 802.3); the CRC register is initialized with 0xFFFFFFFF and the residue is inverted to produce the CRC.

8.1 Boot from QSPI master

If set to boot from QSPI master, the processor enables the six pins specified in Figure 10, and drives the SPI clock at 50 MHz (assuming a 400 MHz core clock). A READ command is issued with a 24-bit address 0x000000. The clock polarity and phase are 0 / 0.

Pin	Signal	Description
X0D01	SS	Slave Select
X0D04..X0D07	SPIO	Data
X0D10	SCLK	Clock

Figure 10: QSPI pins

The xCORE Tile expects each byte to be transferred with the *least-significant nibble first*. Programmers who write bytes into an QSPI interface using the most significant nibble first may have to reverse the nibbles in each byte of the image stored in the QSPI device.

The pins used for QSPI boot are hardcoded in the boot ROM and cannot be changed. If required, an QSPI boot program can be burned into OTP that uses different pins.

The boot-rom on the core will then:

1. Allocate channel-end 0.
2. Input a word on channel-end 0. It will use this word as a channel to acknowledge the boot. Provide the null-channel-end 0x0000FF02 if no acknowledgment is required.
3. Input the boot image specified above, including the CRC.
4. Input an END control token.
5. Output an END control token to the channel-end received in step 2.
6. Free channel-end 0.
7. Jump to the loaded code.

8.5 Boot from OTP

If an xCORE tile is set to use secure boot (see Figure 8), the boot image is read from address 0 of the OTP memory in the tile's security module.

This feature can be used to implement a secure bootloader which loads an encrypted image from external flash, decrypts and CRC checks it with the processor, and discontinues the boot process if the decryption or CRC check fails. XMOS provides a default secure bootloader that can be written to the OTP along with secret decryption keys.

Each tile has its own individual OTP memory, and hence some tiles can be booted from OTP while others are booted from SPI or the channel interface. This enables systems to be partially programmed, dedicating one or more tiles to perform a particular function, leaving the other tiles user-programmable.

8.6 Security register

The security register enables security features on the xCORE tile. The features shown in Figure 13 provide a strong level of protection and are sufficient for providing strong IP security.

9 Memory

9.1 OTP

Each xCORE Tile integrates 8 KB one-time programmable (OTP) memory along with a security register that configures system wide security features. The OTP holds data in four sectors each containing 512 rows of 32 bits which can be used to implement secure bootloaders and store encryption keys. Data for the security register is loaded from the OTP on power up. All additional data in OTP is copied from the OTP to SRAM and executed first on the processor.

12.7 xCORE Tile I/O AC Characteristics

Figure 24: I/O AC characteristics

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
T(XOVALID)	Input data valid window	8			ns	
T(XOINVALID)	Output data invalid window	9			ns	
T(XIFMAX)	Rate at which data can be sampled with respect to an external clock			60	MHz	

The input valid window parameter relates to the capability of the device to capture data input to the chip with respect to an external clock source. It is calculated as the sum of the input setup time and input hold time with respect to the external clock as measured at the pins. The output invalid window specifies the time for which an output is invalid with respect to the external clock. Note that these parameters are specified as a window rather than absolute numbers since the device provides functionality to delay the incoming clock with respect to the incoming data.

Information on interfacing to high-speed synchronous interfaces can be found in the XS1 Port I/O Timing document, X5821.

12.8 xConnect Link Performance

Figure 25: Link performance

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
B(2blinkP)	2b link bandwidth (packetized)			87	MBit/s	A, B
B(5blinkP)	5b link bandwidth (packetized)			217	MBit/s	A, B
B(2blinkS)	2b link bandwidth (streaming)			100	MBit/s	B
B(5blinkS)	5b link bandwidth (streaming)			250	MBit/s	B

A Assumes 32-byte packet in 3-byte header mode. Actual performance depends on size of the header and payload.

B 7.5 ns symbol time.

The asynchronous nature of links means that the relative phasing of CLK clocks is not important in a multi-clock system, providing each meets the required stability criteria.

12.9 JTAG Timing

Figure 26: JTAG timing

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f(TCK_D)	TCK frequency (debug)			18	MHz	
f(TCK_B)	TCK frequency (boundary scan)			10	MHz	
T(SETUP)	TDO to TCK setup time	5			ns	A
T(HOLD)	TDO to TCK hold time	5			ns	A
T(DELAY)	TCK to output delay			15	ns	B

A Timing applies to TMS and TDI inputs.

B Timing applies to TDO output from negative edge of TCK.

All JTAG operations are synchronous to TCK apart from the global asynchronous reset TRST_N.

13.1 Part Marking

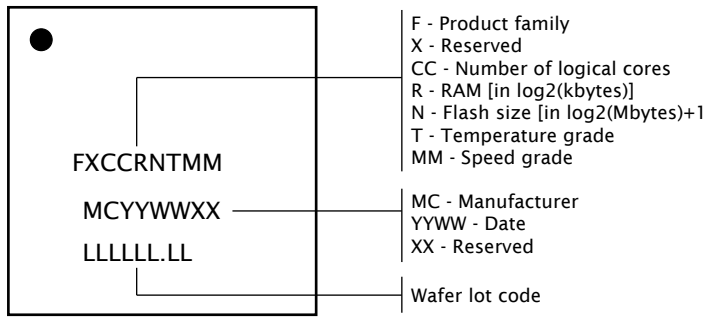

Figure 27: Part marking scheme

14 Ordering Information

Figure 28: Orderable part numbers

Product Code	Marking	Qualification	Speed Grade
XL232-1024-FB374-C40	L132A0C40	Commercial	2000 MIPS
XL232-1024-FB374-I40	L132A0I40	Industrial	2000 MIPS

0x16: Debug interrupt data

Bits	Perm	Init	Description
31:0	DRW		Value.

B.19 Debug core control: 0x18

This register enables the debugger to temporarily disable logical cores. When returning from the debug interrupts, the cores set in this register will not execute. This enables single stepping to be implemented.

0x18: Debug core control

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	DRW		1-hot vector defining which threads are stopped when not in debug mode. Every bit which is set prevents the respective thread from running.

B.20 Debug scratch: 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over JTAG. This is the same set of registers as the Debug Scratch registers in the xCORE tile configuration.

0x20 .. 0x27: Debug scratch

Bits	Perm	Init	Description
31:0	DRW		Value.

B.21 Instruction breakpoint address: 0x30 .. 0x33

This register contains the address of the instruction breakpoint. If the PC matches this address, then a debug interrupt will be taken. There are four instruction breakpoints that are controlled individually.

0x30 .. 0x33: Instruction breakpoint address

Bits	Perm	Init	Description
31:0	DRW		Value.

C Tile Configuration

The xCORE Tile control registers can be accessed using configuration reads and writes (use `write_tile_config_reg(tileref, ...)` and `read_tile_config_reg(tileref, ...)` for reads and writes).

Number	Perm	Description
0x00	CRO	Device identification
0x01	CRO	xCORE Tile description 1
0x02	CRO	xCORE Tile description 2
0x04	CRW	Control PSwitch permissions to debug registers
0x05	CRW	Cause debug interrupts
0x06	CRW	xCORE Tile clock divider
0x07	CRO	Security configuration
0x20 .. 0x27	CRW	Debug scratch
0x40	CRO	PC of logical core 0
0x41	CRO	PC of logical core 1
0x42	CRO	PC of logical core 2
0x43	CRO	PC of logical core 3
0x44	CRO	PC of logical core 4
0x45	CRO	PC of logical core 5
0x46	CRO	PC of logical core 6
0x47	CRO	PC of logical core 7
0x60	CRO	SR of logical core 0
0x61	CRO	SR of logical core 1
0x62	CRO	SR of logical core 2
0x63	CRO	SR of logical core 3
0x64	CRO	SR of logical core 4
0x65	CRO	SR of logical core 5
0x66	CRO	SR of logical core 6
0x67	CRO	SR of logical core 7

Figure 31: Summary

C.1 Device identification: 0x00

This register identifies the xCORE Tile

0x41: PC of logical core 1

Bits	Perm	Init	Description
31:0	CRO		Value.

C.11 PC of logical core 2: 0x42

Value of the PC of logical core 2.

0x42: PC of logical core 2

Bits	Perm	Init	Description
31:0	CRO		Value.

C.12 PC of logical core 3: 0x43

Value of the PC of logical core 3.

0x43: PC of logical core 3

Bits	Perm	Init	Description
31:0	CRO		Value.

C.13 PC of logical core 4: 0x44

Value of the PC of logical core 4.

0x44: PC of logical core 4

Bits	Perm	Init	Description
31:0	CRO		Value.

C.14 PC of logical core 5: 0x45

Value of the PC of logical core 5.

0x45: PC of logical core 5

Bits	Perm	Init	Description
31:0	CRO		Value.

D.8 System JTAG device ID register: 0x09

0x09: System JTAG device ID register

Bits	Perm	Init	Description
31:28	RO		
27:12	RO		
11:1	RO		
0	RO		

D.9 System USERCODE register: 0x0A

0x0A: System USERCODE register

Bits	Perm	Init	Description
31:18	RO		JTAG USERCODE value programmed into OTP SR
17:0	RO		metal fixable ID code

D.10 Directions 0-7: 0x0C

This register contains eight directions, for packets with a mismatch in bits 7..0 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

0x0C: Directions 0-7

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose dimension is 7.
27:24	RW	0	The direction for packets whose dimension is 6.
23:20	RW	0	The direction for packets whose dimension is 5.
19:16	RW	0	The direction for packets whose dimension is 4.
15:12	RW	0	The direction for packets whose dimension is 3.
11:8	RW	0	The direction for packets whose dimension is 2.
7:4	RW	0	The direction for packets whose dimension is 1.
3:0	RW	0	The direction for packets whose dimension is 0.

D.11 Directions 8-15: 0x0D

This register contains eight directions, for packets with a mismatch in bits 15..8 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

0x0D: Directions 8-15

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose dimension is F.
27:24	RW	0	The direction for packets whose dimension is E.
23:20	RW	0	The direction for packets whose dimension is D.
19:16	RW	0	The direction for packets whose dimension is C.
15:12	RW	0	The direction for packets whose dimension is B.
11:8	RW	0	The direction for packets whose dimension is A.
7:4	RW	0	The direction for packets whose dimension is 9.
3:0	RW	0	The direction for packets whose dimension is 8.

D.12 DEBUG_N configuration, tile 0: 0x10

Configures the behavior of the DEBUG_N pin.

0x10: DEBUG_N configuration, tile 0

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Set 1 to enable GlobalDebug to generate debug request to XCore.
0	RW	0	Set 1 to enable inDebug bit to drive GlobalDebug.

D.13 DEBUG_N configuration, tile 1: 0x11

Configures the behavior of the DEBUG_N pin.

0x11: DEBUG_N configuration, tile 1

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Set 1 to enable GlobalDebug to generate debug request to XCore.
0	RW	0	Set 1 to enable inDebug bit to drive GlobalDebug.

D.14 Debug source: 0x1F

Contains the source of the most recent debug event.

G PCB Layout Design Check List

☑ This section is a checklist for use by PCB designers using the XS2-L32A-1024-FB374. Each of the following sections contains items to check for each design.

G.1 Ground Plane

☐ Each ground ball has a via to minimize impedance and conduct heat away from the device. (Section 11.2)

☐ Other than ground vias, there are no (or only a few) vias underneath or closely around the device. This create a good, solid, ground plane.

G.2 Power supply decoupling

☐ The decoupling capacitors are all placed close to a supply pin (Section 11).

☐ The decoupling capacitors are spaced around the device (Section 11).

☐ The ground side of each decoupling capacitor has a direct path back to the center ground of the device.

G.3 PLL_AVDD

☐ The PLL_AVDD filter (especially the capacitor) is placed close to the PLL_AVDD pin (Section 11).

J Revision History

Date	Description
2015-03-20	Preliminary release
2015-04-14	Added RST to pins to be pulled hard, and removed reference to TCK from Errata Removed TRST_N references in packages that have no TRST_N
2015-05-06	Removed references to DEBUG_N
2015-07-09	Updated electrical characteristics - Section 12
2015-08-27	Updated part marking and product code - Section 14
2015-11-23	Updated status of X2D04, X2D05, X2D06, X2D07 during boot - Section 8 Updated Schematics Design Checklist: GPIO for X2D04, X2D05, X2D06, X2D07 during boot - Section F
2015-12-18	Clarified connectivity of internal and external xCONNECT links - Sections 3 and 4 Made pin names canonical - Sections 3 and 4 Updated JTAG diagram - Section 10 Removed references to 400MHz parts - Section 12
2016-01-05	Updated signal tables to use VDDIO - Section 4 Updated IDD value - Section 12 Updated land pattern description - Section 11.1
2016-04-20	Typical internal pull-up and pull down current diagrams added - Section 12
