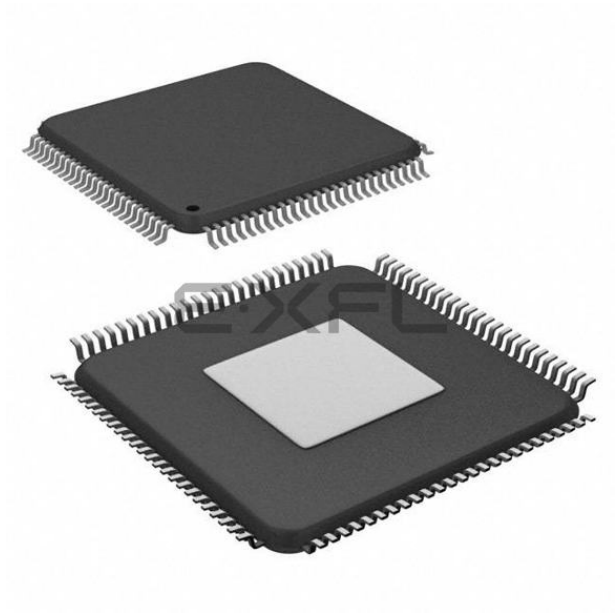
Infineon Technologies - XE164GM24F80LAAFXUMA1 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	C166SV2
Core Size	16-Bit
Speed	80MHz
Connectivity	CANbus, EBI/EMI, I²C, LINbus, SPI, SSC, UART/USART, USI
Peripherals	I²S, POR, PWM, WDT
Number of I/O	76
Program Memory Size	192KB (192K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	24K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 11x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP Exposed Pad
Supplier Device Package	PG-LQFP-100-8
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xe164gm24f80laafxuma1

2 General Device Information

The XE164xM series (16-Bit Single-Chip
Real Time Signal Controller) is a part of the Infineon XE166 Family of full-feature single-chip CMOS microcontrollers. These devices extend the functionality and performance of the C166 Family in terms of instructions (MAC unit), peripherals, and speed. They combine high CPU performance (up to 80 million instructions per second) with extended peripheral functionality and enhanced IO capabilities. Optimized peripherals can be adapted flexibly to meet the application requirements. These derivatives utilize clock generation via PLL and internal or external clock sources. On-chip memory modules include program Flash, program RAM, and data RAM.

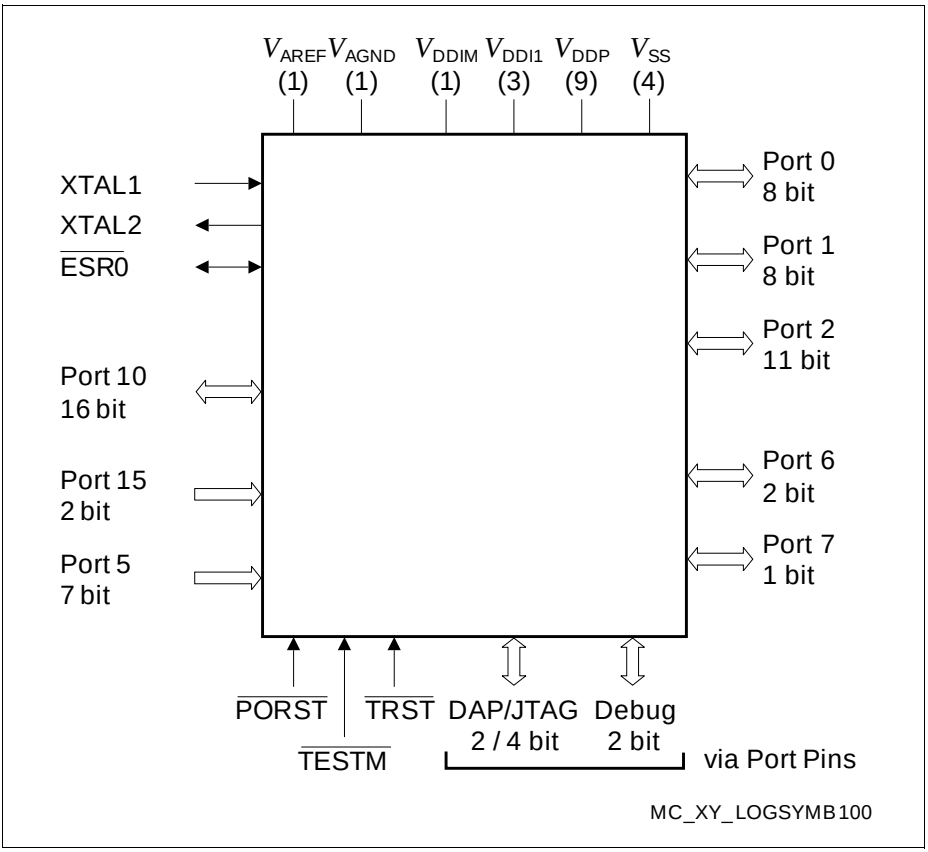


Figure 2 XE164xM Logic Symbol

2.1 Pin Configuration and Definition

The pins of the XE164xM are described in detail in **Table 5**, which includes all alternate functions. For further explanations please refer to the footnotes at the end of the table. The following figure summarizes all pins, showing their locations on the four sides of the package.

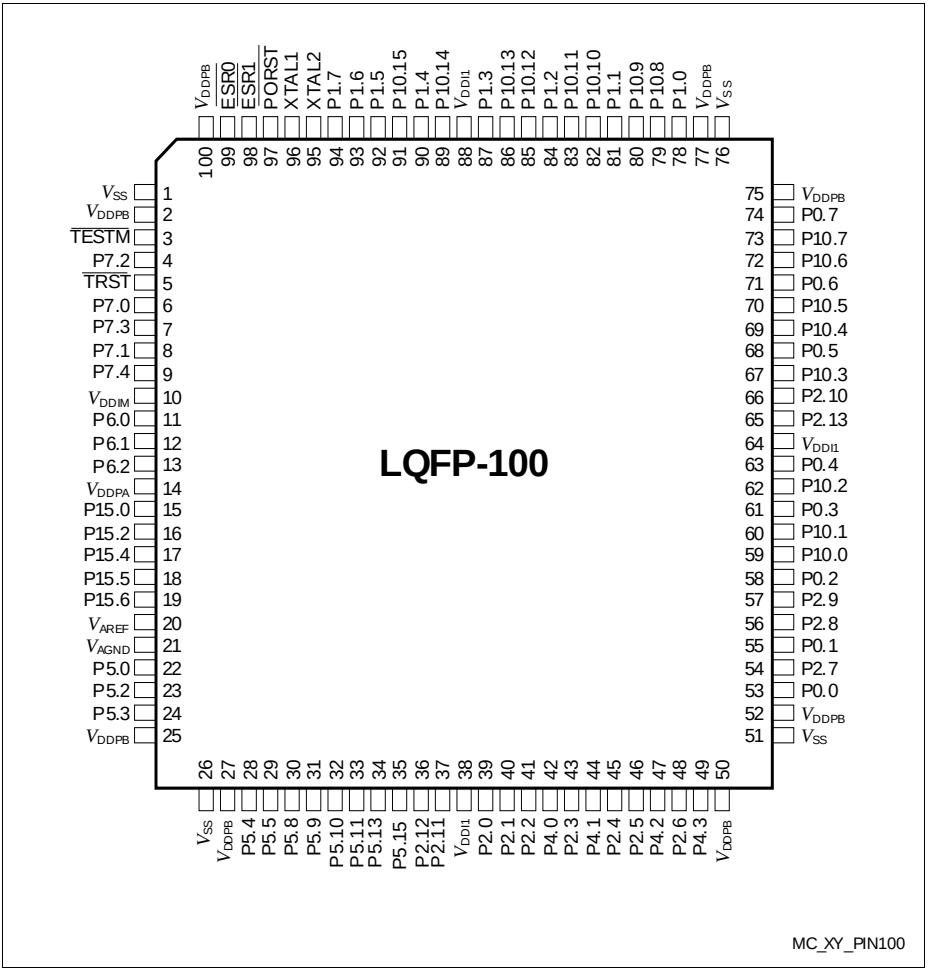

Figure 3 XE164xM Pin Configuration (top view)

Key to Pin Definitions

- **Ctrl.**: The output signal for a port pin is selected by bit field PC in the associated register Px_IOCRy. Output O0 is selected by setting the respective bit field PC to $1x00_B$, output O1 is selected by $1x01_B$, etc.
  Output signal OH is controlled by hardware.
- **Type**: Indicates the pad type and its power supply domain (A, B, M, 1).
  - St: Standard pad
  - Sp: Special pad e.g. XTALx
  - DP: Double pad - can be used as standard or high speed pad
  - In: Input only pad
  - PS: Power supply pad

Table 5 Pin Definitions and Functions

Pin	Symbol	Ctrl.	Type	Function
3	$\overline{\text{TESTM}}$	I	In/B	**Testmode Enable** Enables factory test modes, must be held HIGH for normal operation (connect to V_{DDPB}). An internal pull-up device will hold this pin high when nothing is driving it.
4	P7.2	O0 / I	St/B	**Bit 2 of Port 7, General Purpose Input/Output**
	EMUX0	O1	St/B	**External Analog MUX Control Output 0 (ADC1)**
	CCU62_CCPOS0A	I	St/B	**CCU62 Position Input 0**
	TDI_C	IH	St/B	**JTAG Test Data Input** If JTAG pos. C is selected during start-up, an internal pull-up device will hold this pin high when nothing is driving it.
5	$\overline{\text{TRST}}$	I	In/B	**Test-System Reset Input** For normal system operation, pin $\overline{\text{TRST}}$ should be held low. A high level at this pin at the rising edge of $\overline{\text{PORST}}$ activates the XE164xM's debug system. In this case, pin $\overline{\text{TRST}}$ must be driven low once to reset the debug system. An internal pull-down device will hold this pin low when nothing is driving it.

Table 5 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
62	P10.2	O0 / I	St/B	**Bit 2 of Port 10, General Purpose Input/Output**
	U0C0_SCLKOUT	O1	St/B	**USIC0 Channel 0 Shift Clock Output**
	CCU60_CC62	O2	St/B	**CCU60 Channel 2 Output**
	AD2	OH / IH	St/B	**External Bus Interface Address/Data Line 2**
	CCU60_CC62INA	I	St/B	**CCU60 Channel 2 Input**
	U0C0_DX1B	I	St/B	**USIC0 Channel 0 Shift Clock Input**
63	P0.4	O0 / I	St/B	**Bit 4 of Port 0, General Purpose Input/Output**
	U1C1_SELO0	O1	St/B	**USIC1 Channel 1 Select/Control 0 Output**
	U1C0_SELO1	O2	St/B	**USIC1 Channel 0 Select/Control 1 Output**
	CCU61_COUT61	O3	St/B	**CCU61 Channel 1 Output**
	A4	OH	St/B	**External Bus Interface Address Line 4**
	U1C1_DX2A	I	St/B	**USIC1 Channel 1 Shift Control Input**
	RxDC1B	I	St/B	**CAN Node 1 Receive Data Input**
	ESR2_8	I	St/B	**ESR2 Trigger Input 8**
65	P2.13	O0 / I	St/B	**Bit 13 of Port 2, General Purpose Input/Output**
	U2C1_SELO2	O1	St/B	**USIC2 Channel 1 Select/Control 2 Output**
	RxDC2D	I	St/B	**CAN Node 2 Receive Data Input**
66	P2.10	O0 / I	St/B	**Bit 10 of Port 2, General Purpose Input/Output**
	U0C1_DOUT	O1	St/B	**USIC0 Channel 1 Shift Data Output**
	U0C0_SELO3	O2	St/B	**USIC0 Channel 0 Select/Control 3 Output**
	CC2_CC23	O3 / I	St/B	**CAPCOM2 CC23IO Capture Inp./ Compare Out.**
	A23	OH	St/B	**External Bus Interface Address Line 23**
	U0C1_DX0E	I	St/B	**USIC0 Channel 1 Shift Data Input**
	CAPINA	I	St/B	**GPT12E Register CAPREL Capture Input**

Table 5 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
73	P10.7	O0 / I	St/B	**Bit 7 of Port 10, General Purpose Input/Output**
	U0C1_DOUT	O1	St/B	**USIC0 Channel 1 Shift Data Output**
	CCU60_COUT63	O2	St/B	**CCU60 Channel 3 Output**

	CCU62_CTRAPB	I	St/B	**CCU62 Emergency Trap Input**
	T6INB	I	St/B	**GPT12E Timer T6 Count/Gate Input**

3.1 Memory Subsystem and Organization

The memory space of the XE164xM is configured in the von Neumann architecture. In this architecture all internal and external resources, including code memory, data memory, registers and I/O ports, are organized in the same linear address space.

Table 7 XE164xM Memory Map [1)]

Address Area	Start Loc.	End Loc.	Area Size[2)]	Notes
IMB register space	$FF'FF00_H$	$FF'FFFF_H$	256 Bytes	–
Reserved (Access trap)	$F0'0000_H$	$FF'FEFF_H$	<1 Mbyte	Minus IMB registers
Reserved for EPSRAM	$E8'8000_H$	$EF'FFFF_H$	480 Kbytes	Mirrors EPSRAM
Emulated PSRAM	$E8'0000_H$	$E8'7FFF_H$	32 Kbytes	With Flash timing
Reserved for PSRAM	$E0'8000_H$	$E7'FFFF_H$	480 Kbytes	Mirrors PSRAM
Program SRAM	$E0'0000_H$	$E0'7FFF_H$	32 Kbytes	Maximum speed
Reserved for Flash	$CD'0000_H$	$DF'FFFF_H$	<1.25 Mbytes	–
Program Flash 3	$CC'0000_H$	$CC'FFFF_H$	64 Kbytes	–
Program Flash 2	$C8'0000_H$	$CB'FFFF_H$	256 Kbytes	–
Program Flash 1	$C4'0000_H$	$C7'FFFF_H$	256 Kbytes	–
Program Flash 0	$C0'0000_H$	$C3'FFFF_H$	256 Kbytes	[3)]
External memory area	$40'0000_H$	$BF'FFFF_H$	8 Mbytes	–
Available Ext. IO area[4)]	$21'0000_H$	$3F'FFFF_H$	< 2 Mbytes	Minus USIC/CAN
Reserved	$20'BC00_H$	$20'FFFF_H$	17 Kbytes	–
USIC alternate regs.	$20'B000_H$	$20'BFFF_H$	4 Kbytes	Accessed via EBC
MultiCAN alternate regs.	$20'8000_H$	$20'AFFF_H$	12 Kbytes	Accessed via EBC
Reserved	$20'6000_H$	$20'7FFF_H$	8 Kbytes	–
USIC registers	$20'4000_H$	$20'5FFF_H$	8 Kbytes	Accessed via EBC
MultiCAN registers	$20'0000_H$	$20'3FFF_H$	16 Kbytes	Accessed via EBC
External memory area	$01'0000_H$	$1F'FFFF_H$	< 2 Mbytes	Minus segment 0
SFR area	$00'FE00_H$	$00'FFFF_H$	0.5 Kbyte	–
Dual-Port RAM	$00'F600_H$	$00'FDFF_H$	2 Kbytes	–
Reserved for DPRAM	$00'F200_H$	$00'F5FF_H$	1 Kbyte	–
ESFR area	$00'F000_H$	$00'F1FF_H$	0.5 Kbyte	–
XSFR area	$00'E000_H$	$00'EFFF_H$	4 Kbytes	–

3.2 External Bus Controller

All external memory access operations are performed by a special on-chip External Bus Controller (EBC). The EBC also controls access to resources connected to the on-chip LXBus (MultiCAN and the USIC modules). The LXBus is an internal representation of the external bus that allows access to integrated peripherals and modules in the same way as to external components.

The EBC can be programmed either to Single Chip Mode, when no external memory is required, or to an external bus mode with the following selections[1]:

- Address Bus Width with a range of 0 … 24-bit
- Data Bus Width 8-bit or 16-bit
- Bus Operation Multiplexed or Demultiplexed

The bus interface uses Port 10 and Port 2 for addresses and data. In the demultiplexed bus modes, the lower addresses are output separately on Port 0 and Port 1. The number of active segment address lines is selectable, restricting the external address space to 8 Mbytes … 64 Kbytes. This is required when interface lines shall be assigned to Port 2.

External $\overline{CS}$ signals (address windows plus default) can be generated and output on Port 4 in order to save external glue logic. External modules can be directly connected to the common address/data bus and their individual select lines.

Important timing characteristics of the external bus interface are programmable (with registers TCONCSx/FCONCSx) to allow the user to adapt it to a wide range of different types of memories and external peripherals.
Access to very slow memories or modules with varying access times is supported by a special ‘Ready’ function. The active level of the control input signal is selectable.

In addition, up to four independent address windows may be defined (using registers ADDRSELx) to control access to resources with different bus characteristics. These address windows are arranged hierarchically where window 4 overrides window 3, and window 2 overrides window 1. All accesses to locations not covered by these four address windows are controlled by TCONCS0/FCONCS0. The currently active window can generate a chip select signal.

The external bus timing is based on the rising edge of the reference clock output CLKOUT. The external bus protocol is compatible with that of the standard C166 Family.

1) Bus modes are switched dynamically if several address windows with different mode settings are used.

Target Protocols

Each USIC channel can receive and transmit data frames with a selectable data word width from 1 to 16 bits in each of the following protocols:

- **UART** (asynchronous serial channel)
  - module capability: maximum baud rate = f_{SYS} / 4
  - data frame length programmable from 1 to 63 bits
  - MSB or LSB first
- **LIN** Support (Local Interconnect Network)
  - module capability: maximum baud rate = f_{SYS} / 16
  - checksum generation under software control
  - baud rate detection possible by built-in capture event of baud rate generator
- **SSC/SPI** (synchronous serial channel with or without data buffer)
  - module capability: maximum baud rate = f_{SYS} / 2, limited by loop delay
  - number of data bits programmable from 1 to 63, more with explicit stop condition
  - MSB or LSB first
  - optional control of slave select signals
- **IIC** (Inter-IC Bus)
  - supports baud rates of 100 kbit/s and 400 kbit/s
- **IIS** (Inter-IC Sound Bus)
  - module capability: maximum baud rate = f_{SYS} / 2

Note: Depending on the selected functions (such as digital filters, input synchronization stages, sample point adjustment, etc.), the maximum achievable baud rate can be limited. Please note that there may be additional delays, such as internal or external propagation delays and driver delays (e.g. for collision detection in UART mode, for IIC, etc.).

4.1.2 Operating Conditions

The following operating conditions must not be exceeded to ensure correct operation of the XE164xM. All parameters specified in the following sections refer to these operating conditions, unless otherwise noticed.

Note: Typical parameter values refer to room temperature and nominal supply voltage, minimum/maximum parameter values also include conditions of minimum/maximum temperature and minimum/maximum supply voltage. Additional details are described where applicable.

Table 12 Operating Conditions

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Voltage Regulator Buffer Capacitance for DMP_M	C_{EVRM} SR	1.0	–	4.7	µF	1)
Voltage Regulator Buffer Capacitance for DMP_1	C_{EVR1} SR	0.47	–	2.2	µF	1)2)
External Load Capacitance	C_L SR	–	20[3)]	–	pF	pin out driver= default 4)
System frequency	f_{SYS} SR	–	–	100	MHz	5)
Overload current for analog inputs[6)]	I_{OVA} SR	-2	–	5	mA	not subject to production test
Overload current for digital inputs[6)]	I_{OVD} SR	-5	–	5	mA	not subject to production test
Overload current coupling factor for analog inputs[7)]	K_{OVA} CC	–	2.5×10^{-4}	1.5×10^{-3}	-	$I_{OV} < 0$ mA; not subject to production test
		–	1.0×10^{-6}	1.0×10^{-4}	-	$I_{OV} > 0$ mA; not subject to production test
Overload current coupling factor for digital I/O pins	K_{OVD} CC	–	1.0×10^{-2}	3.0×10^{-2}		$I_{OV} < 0$ mA; not subject to production test
		–	1.0×10^{-4}	5.0×10^{-3}		$I_{OV} > 0$ mA; not subject to production test

Pullup/Pulldown Device Behavior

Most pins of the XE164xM feature pullup or pulldown devices. For some special pins these are fixed; for the port pins they can be selected by the application.

The specified current values indicate how to load the respective pin depending on the intended signal level. **Figure 13** shows the current paths.

The shaded resistors shown in the figure may be required to compensate system pull currents that do not match the given limit values.

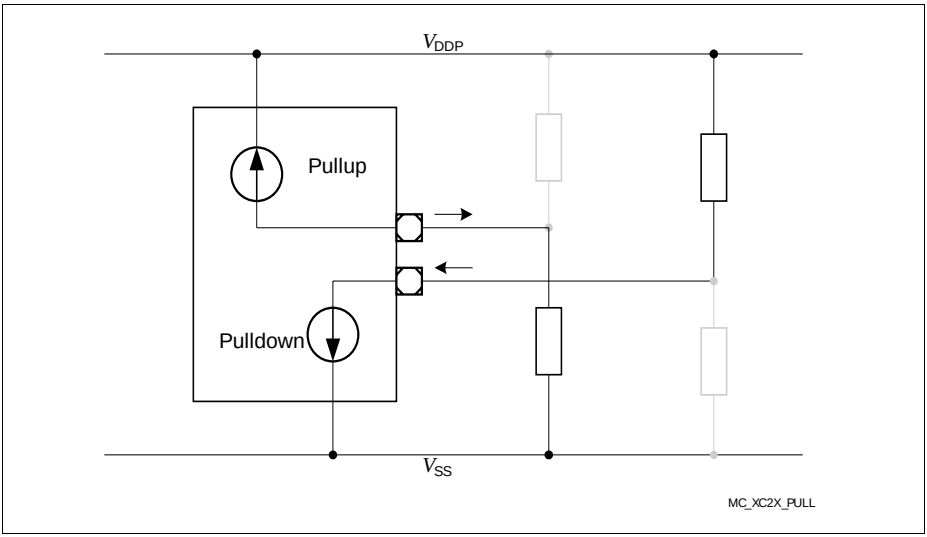

Figure 13 Pullup/Pulldown Current Definition

4.2.1 DC Parameters

Keeping signal levels within the limits specified in this table ensures operation without overload conditions. For signal levels outside these specifications, also refer to the specification of the overload current I_{OV}.

Note: Operating Conditions apply.

Table 13 is valid under the following conditions:
$V_{DDP} \geq 4.5$ V; $V_{DDPtyp} = 5$ V; $V_{DDP} \leq 5.5$ V

Table 13 DC Characteristics for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Pin capacitance (digital inputs/outputs). To be doubled for double bond pins.[1)]	C_{IO} CC	–	–	10	pF	not subject to production test
Input Hysteresis[2)]	HYS CC	0.11 x V_{DDP}	–	–	V	R_S = 0 Ohm
Absolute input leakage current on pins of analog ports[3)]	$\|I_{OZ1}\|$ CC	–	10	200	nA	$V_{IN} > 0$ V; $V_{IN} < V_{DDP}$
Absolute input leakage current for all other pins. To be doubled for double bond pins.[3)1)4)]	$\|I_{OZ2}\|$ CC	–	0.2	5	µA	$T_J \leq 110$ °C; $V_{IN} < V_{DDP}$; $V_{IN} > V_{SS}$
		–	0.2	15	µA	$T_J \leq 150$ °C; $V_{IN} < V_{DDP}$; $V_{IN} > V_{SS}$
Pull Level Force Current[5)]	$\|I_{PLF}\|$ SR	250	–	–	µA	[6)]
Pull Level Keep Current[7)]	$\|I_{PLK}\|$ SR	–	–	30	µA	[6)]
Input high voltage (all except XTAL1)	V_{IH} SR	0.7 x V_{DDP}	–	V_{DDP} + 0.3	V	
Input low voltage (all except XTAL1)	V_{IL} SR	-0.3	–	0.3 x V_{DDP}	V	
Output High voltage[8)]	V_{OH} CC	V_{DDP} - 1.0	–	–	V	$I_{OH} \geq I_{OHmax}$
		V_{DDP} - 0.4	–	–	V	$I_{OH} \geq I_{OHnom}$[9)]

4.4 System Parameters

The following parameters specify several aspects which are important when integrating the XE164xM into an application system.

Note: These parameters are not subject to production test but verified by design and/or characterization.

Note: Operating Conditions apply.

Table 19 Various System Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Short-term deviation of internal clock source frequency[1]	Δf_{INT} CC	-1	–	1	%	$\Delta T_J \leq 10$ °C
Internal clock source frequency	f_{INT} CC	4.8	5.0	5.2	MHz	
Wakeup clock source frequency[2]	f_{WU} CC	400	–	700	kHz	FREQSEL= 00
		210	–	390	kHz	FREQSEL= 01
		140	–	260	kHz	FREQSEL= 10
		110	–	200	kHz	FREQSEL= 11
Startup time from power-on with code execution from Flash	t_{SPO} CC	1.8	2.2	2.7	ms	f_{WU} = 500 kHz
Startup time from stopover mode with code execution from PSRAM	t_{SSO} CC	11 / f_{WU}[3]	–	12 / f_{WU}[3]	µs	
Core voltage (PVC) supervision level	V_{PVC} CC	V_{LV} - 0.03	V_{LV}	V_{LV} + 0.07[4]	V	[5]
Supply watchdog (SWD) supervision level	V_{SWD} CC	V_{LV} - 0.10[6]	V_{LV}	V_{LV} + 0.15	V	Lower voltage range[5]
		V_{LV} - 0.15	V_{LV}	V_{LV} + 0.15	V	Upper voltage range[5]

1) The short-term frequency deviation refers to a timeframe of a few hours and is measured relative to the current frequency at the beginning of the respective timeframe. This parameter is useful to determine a time span for re-triggering a LIN synchronization.

2) This parameter is tested for the fastest and the slowest selection. The medium selections are not subject to production test - verified by design/characterization

The timing in the AC Characteristics refers to TCSs. Timing must be calculated using the minimum TCS possible under the given circumstances.
The actual minimum value for TCS depends on the jitter of the PLL. Because the PLL is constantly adjusting its output frequency to correspond to the input frequency (from crystal or oscillator), the accumulated jitter is limited. This means that the relative deviation for periods of more than one TCS is lower than for a single TCS (see formulas and **Figure 20**).

This is especially important for bus cycles using waitstates and for the operation of timers, serial interfaces, etc. For all slower operations and longer periods (e.g. pulse train generation or measurement, lower baudrates, etc.) the deviation caused by the PLL jitter is negligible.

The value of the accumulated PLL jitter depends on the number of consecutive VCO output cycles within the respective timeframe. The VCO output clock is divided by the output prescaler K2 to generate the system clock signal f_{SYS}. The number of VCO cycles is K2 × **T**, where **T** is the number of consecutive f_{SYS} cycles (TCS).

The maximum accumulated jitter (long-term jitter) D_{Tmax} is defined by:

D_{Tmax} [ns] = $\pm(220 / (K2 \times f_{SYS}) + 4.3)$

This maximum value is applicable, if either the number of clock cycles T > (f_{SYS} / 1.2) or the prescaler value K2 > 17.

In all other cases for a timeframe of **T** × TCS the accumulated jitter D_T is determined by:

D_T [ns] = $D_{Tmax} \times [(1 - 0.058 \times K2) \times (T - 1) / (0.83 \times f_{SYS} - 1) + 0.058 \times K2]$

f_{SYS} in [MHz] in all formulas.

Example, for a period of 3 TCSs @ 33 MHz and K2 = 4:

$D_{max} = \pm(220 / (4 \times 33) + 4.3) = 5.97$ ns (Not applicable directly in this case!)

$D_3 = 5.97 \times [(1 - 0.058 \times 4) \times (3 - 1) / (0.83 \times 33 - 1) + 0.058 \times 4]$
$= 5.97 \times [0.768 \times 2 / 26.39 + 0.232]$
$= 1.7$ ns

Example, for a period of 3 TCSs @ 33 MHz and K2 = 2:

$D_{max} = \pm(220 / (2 \times 33) + 4.3) = 7.63$ ns (Not applicable directly in this case!)

$D_3 = 7.63 \times [(1 - 0.058 \times 2) \times (3 - 1) / (0.83 \times 33 - 1) + 0.058 \times 2]$
$= 7.63 \times [0.884 \times 2 / 26.39 + 0.116]$
$= 1.4$ ns

4.6.3 External Clock Input Parameters

These parameters specify the external clock generation for the XE164xM. The clock can be generated in two ways:

- By connecting a **crystal or ceramic resonator** to pins XTAL1/XTAL2
- By supplying an **external clock signal**
  - This clock signal can be supplied either to pin XTAL1 (core voltage domain) or to pin CLKIN1 (IO voltage domain)

If connected to CLKIN1, the input signal must reach the defined input levels V_{IL} and V_{IH}. If connected to XTAL1, a minimum amplitude V_{AX1} (peak-to-peak voltage) is sufficient for the operation of the on-chip oscillator.

Note: The given clock timing parameters (t_1 … t_4) are only valid for an external clock input signal.

Note: Operating Conditions apply.

Table 24 External Clock Input Characteristics

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Oscillator frequency	f_{OSC} SR	4	–	40	MHz	Input = clock signal
		4	–	16	MHz	Input = crystal or ceramic resonator
XTAL1 input current absolute value	$\|I_{IL}\|$ CC	–	–	20	µA	
Input clock high time	t_1 SR	6	–	–	ns	
Input clock low time	t_2 SR	6	–	–	ns	
Input clock rise time	t_3 SR	–	–	8	ns	
Input clock fall time	t_4 SR	–	–	8	ns	
Input voltage amplitude on XTAL1[1)]	V_{AX1} SR	0.3 x V_{DDIM}	–	–	V	4 to 16 MHz
		0.4 x V_{DDIM}	–	–	V	16 to 25 MHz
		0.5 x V_{DDIM}	–	–	V	25 to 40 MHz
Input voltage range limits for signal on XTAL1	V_{IX1} SR	-1.7 + V_{DDIM}	–	1.7	V	[2)]

Note: The term CLKOUT refers to the reference clock output signal which is generated by selecting f_{SYS} as the source signal for the clock output signal EXTCLK on pin P2.8 and by enabling the high-speed clock driver on this pin.

Variable Memory Cycles

External bus cycles of the XE164xM are executed in five consecutive cycle phases (AB, C, D, E, F). The duration of each cycle phase is programmable (via the TCONCSx registers) to adapt the external bus cycles to the respective external module (memory, peripheral, etc.).

The duration of the access phase can optionally be controlled by the external module using the READY handshake input.

This table provides a summary of the phases and the ranges for their length.

Table 28 Programmable Bus Cycle Phases (see timing diagrams)

Bus Cycle Phase	Parameter	Valid Values	Unit
Address setup phase, the standard duration of this phase (1 … 2 TCS) can be extended by 0 … 3 TCS if the address window is changed	tpAB	1 … 2 (5)	TCS
Command delay phase	tpC	0 … 3	TCS
Write Data setup/MUX Tristate phase	tpD	0 … 1	TCS
Access phase	tpE	1 … 32	TCS
Address/Write Data hold phase	tpF	0 … 3	TCS

Note: The bandwidth of a parameter (from minimum to maximum value) covers the whole operating range (temperature, voltage) as well as process variations. Within a given device, however, this bandwidth is smaller than the specified range. This is also due to interdependencies between certain parameters. Some of these interdependencies are described in additional notes (see standard timing).

Note: Operating Conditions apply; C_L = 20 pF.

Table 29 EBC External Bus Timing for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Output valid delay for $\overline{RD}$, $\overline{WR}$(L/$\overline{H}$)	t_{10} CC	–	7	13	ns	
Output valid delay for $\overline{BHE}$, ALE	t_{11} CC	–	7	14	ns	
Address output valid delay for A23 ... A0	t_{12} CC	–	8	14	ns	
Address output valid delay for AD15 ... AD0 (MUX mode)	t_{13} CC	–	8	15	ns	
Output valid delay for $\overline{CS}$	t_{14} CC	–	7	13	ns	
Data output valid delay for AD15 ... AD0 (write data, MUX mode)	t_{15} CC	–	8	15	ns	
Data output valid delay for D15 ... D0 (write data, DEMUX mode)	t_{16} CC	–	8	15	ns	
Output hold time for $\overline{RD}$, $\overline{WR}$(L/$\overline{H}$)	t_{20} CC	-2	6	8	ns	
Output hold time for $\overline{BHE}$, ALE	t_{21} CC	-2	6	10	ns	
Address output hold time for AD15 ... AD0	t_{23} CC	-3	6	8	ns	
Output hold time for $\overline{CS}$	t_{24} CC	-3	6	11	ns	
Data output hold time for D15 ... D0 and AD15 ... AD0	t_{25} CC	-3	6	8	ns	
Input setup time for READY, D15 ... D0, AD15 ... AD0	t_{30} SR	25	15	–	ns	
Input hold time READY, D15 ... D0, AD15 ... AD0[1)]	t_{31} SR	0	-7	–	ns	

1) Read data are latched with the same internal clock edge that triggers the address change and the rising edge of RD. Address changes before the end of RD have no impact on (demultiplexed) read cycles. Read data can change after the rising edge of RD.

Table 38 JTAG Interface Timing for Lower Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCK clock period	t_1 SR	50[1]	–	–	ns	[2]
TCK high time	t_2 SR	16	–	–	ns	
TCK low time	t_3 SR	16	–	–	ns	
TCK clock rise time	t_4 SR	–	–	8	ns	
TCK clock fall time	t_5 SR	–	–	8	ns	
TDI/TMS setup to TCK rising edge	t_6 SR	6	–	–	ns	
TDI/TMS hold after TCK rising edge	t_7 SR	6	–	–	ns	
TDO valid from TCK falling edge (propagation delay)[3]	t_8 CC	–	32	36	ns	
TDO high impedance to valid output from TCK falling edge[4][3]	t_9 CC	–	32	36	ns	
TDO valid output to high impedance from TCK falling edge[3]	t_{10} CC	–	32	36	ns	
TDO hold after TCK falling edge[3]	t_{18} CC	5	–	–	ns	

1) The debug interface cannot operate faster than the overall system, therefore $t_1 \geq t_{SYS}$.

2) Under typical conditions, the interface can operate at transfer rates up to 20 MHz.

3) The falling edge on TCK is used to generate the TDO timing.

4) The setup time for TDO is given implicitly by the TCK cycle time.

Package Outlines

All dimensions in mm.

You can find complete information about Infineon packages, packing and marking in our Infineon Internet Page “Packages”: **http://www.infineon.com/packages**

5.3 Quality Declarations

The operation lifetime of the XE164xM depends on the operating temperature. The life time decreases with increasing temperature as shown in **Table 41**.

Table 40 Quality Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Operation lifetime	t_{OP} CC	–	–	20	a	See **Table 41**
ESD susceptibility according to Human Body Model (HBM)	V_{HBM} SR	–	–	2 000	V	EIA/JESD22-A114-B
Moisture sensitivity level	MSL CC	–	–	3	–	JEDEC J-STD-020C

Table 41 Lifetime dependency from Temperature

Operating Time	Operating Temperature
20 a	$T_J \leq 110°C$
95 500 h	$T_J = 120°C$
68 500 h	$T_J = 125°C$
49 500 h	$T_J = 130°C$
26 400 h	$T_J = 140°C$
14 500 h	$T_J = 150°C$
