What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

7.13.3 SPI Flash Interface (SPIFI)

The SPI Flash Interface allows low-cost serial flash memories to be connected to the ARM Cortex-M3 processor with little performance penalty compared to parallel flash devices with higher pin count.

After a few commands configure the interface at startup, the entire flash content is accessible as normal memory using byte, halfword, and word accesses by the processor and/or DMA channels. Simple sequences of commands handle erasing and programming.

Many serial flash devices use a half-duplex command-driven SPI protocol for device setup and initialization and then move to a half-duplex, command-driven 4-bit protocol for normal operation. Different serial flash vendors and devices accept or require different commands and command formats. SPIFI provides sufficient flexibility to be compatible with common flash devices and includes extensions to help insure compatibility with future devices.

7.13.3.1 Features

- Interfaces to serial flash memory in the main memory map.
- Supports classic and 4-bit bidirectional serial protocols.
- Half-duplex protocol compatible with various vendors and devices.
- Quad SPI Flash Interface (SPIFI) with 1-, 2-, or 4-bit data at rates of up to 52 MB per second.
- Supports DMA access.

7.13.4 SD/MMC card interface

The SD/MMC card interface supports the following modes:

- Secure Digital memory (SD version 3.0)
- Secure Digital I/O (SDIO version 2.0)
- Consumer Electronics Advanced Transport Architecture (CE-ATA version 1.1)

7.14 Digital serial peripherals

7.14.5 I²S interface

Remark: The LPC1850/30/20/10 contain two I²S interfaces.

The I²S-bus provides a standard communication interface for digital audio applications.

The *I²S-bus specification* defines a 3-wire serial bus using one data line, one clock line, and one word select signal. The basic I²S-bus connection has one master, which is always the master, and one slave. The I²S-bus interface provides a separate transmit and receive channel, each of which can operate as either a master or a slave.

[9] A Fast-mode I^2C-bus device can be used in a Standard-mode I^2C-bus system but the requirement $t_{SU;DAT}$ = 250 ns must then be met. This will automatically be the case if the device does not stretch the LOW period of the SCL signal. If such a device does stretch the LOW period of the SCL signal, it must output the next data bit to the SDA line $t_{r(max)} + t_{SU;DAT}$ = 1000 + 250 = 1250 ns (according to the Standard-mode I^2C-bus specification) before the SCL line is released. Also the acknowledge timing must meet this set-up time.

13.2 Crystal oscillator

The crystal oscillator is controlled by the XTAL_OSC_CTRL register in the CGU (see *LPC18xx user manual*).

The crystal oscillator operates at frequencies of 1 MHz to 25 MHz. This frequency can be boosted to a higher frequency, up to the maximum CPU operating frequency, by the PLL.

The oscillator can operate in one of two modes: slave mode and oscillation mode.

- In slave mode, couple the input clock signal with a capacitor of 100 pF (C_C in Figure 41), with an amplitude of at least 200 mV (RMS). The XTAL2 pin in this configuration can be left unconnected.
- External components and models used in oscillation mode are shown in Figure 42, and in Table 38 and Table 39. Since the feedback resistance is integrated on chip, only a crystal and the capacitances CX1 and CX2 need to be connected externally in case of fundamental mode oscillation (L, CL and RS represent the fundamental frequency). Capacitance C_P in Figure 42 represents the parallel package capacitance and must not be larger than 7 pF. Parameters FC, CL, RS and CP are supplied by the crystal manufacturer.

Modifications:	• IEEE standard 802.3 compliance added to Section 11.13. Covers Ethernet dynamic characteristics of ENET_MDIO and ENET_MDC signals. • Parameter C_I corrected for high-drive pins (changed from 2 pF to 5.2 pF). See Table 10. • Table 18 “Dynamic characteristic: I/O pins[1]” added. • IRC accuracy changed from 1 % to 1.5 % over the full temperature range. See Table 16 “Dynamic characteristic: IRC oscillator”. • Description of internal pull-up resistor configuration added for $\overline{\text{RESET}}$, WAKEUPn, and ALARM pins. See Table 3. • Description of DEBUG pin updated. • Input range for PLL1 corrected: 1 MHz to 25 MHz. See Section 7.18.7 “System PLL1”. • Section 13.7 “Suggested USB interface solutions” added. • Reset state of the RTC alarm pin RTC_ALARM added. See Table 3. • Signal polarity corrected for signals EMC_CKEOUT and EMC_DQMOUT. Both signals are active HIGH. • SPIFI output timing parameters in Table 31 corrected to apply to Mode 0: – $t_{v(Q)}$ changed to 3.2 ns. – $t_{h(Q)}$ changed to 0.2 ns, • Parameter t_{CSLWEL} with condition PB = 1 corrected: (WAITWEN + 1) × $T_{cy(clk)}$ added. See Table 23 “Dynamic characteristics: Static asynchronous external memory interface”. • Parameter $t_{CSLBLSL}$ with condition PB = 0 corrected: (WAITWEN + 1) × $T_{cy(clk)}$ added. See Table 23 “Dynamic characteristics: Static asynchronous external memory interface”. • SSP master mode timing diagram updated with SSEL timing parameters. See Figure 29 “SSP master timing in SPI mode”. • Parameters t_{lead}, t_{lag}, and t_d added in Table 22 “Dynamic characteristics: SSP pins in SPI mode”.
