Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

| | |
|--------------------------------|---|
| Product Status | Obsolete |
| Number of LABs/CLBs | 72 |
| Number of Logic Elements/Cells | 576 |
| Total RAM Bits | 6144 |
| Number of I/O | 134 |
| Number of Gates | 31000 |
| Voltage - Supply | 4.5V ~ 5.5V |
| Mounting Type | Surface Mount |
| Operating Temperature | -40°C ~ 85°C (TA) |
| Package / Case | 208-BFQFP |
| Supplier Device Package | 208-PQFP (28x28) |
| Purchase URL | https://www.e-xfl.com/product-detail/intel/epf10k10qi208-4 |

Table 2. FLEX 10KE Device Features

| Feature | EPF10K100E (2) | EPF10K130E | EPF10K200E EPF10K200S |
|-----------------------|----------------|------------|--------------------------|
| Typical gates (1) | 100,000 | 130,000 | 200,000 |
| Maximum system gates | 257,000 | 342,000 | 513,000 |
| Logic elements (LEs) | 4,992 | 6,656 | 9,984 |
| EABs | 12 | 16 | 24 |
| Total RAM bits | 49,152 | 65,536 | 98,304 |
| Maximum user I/O pins | 338 | 413 | 470 |

Note to tables:

- (1) The embedded IEEE Std. 1149.1 JTAG circuitry adds up to 31,250 gates in addition to the listed typical or maximum system gates.
- (2) New EPF10K100B designs should use EPF10K100E devices.

...and More Features

- Fabricated on an advanced process and operate with a 2.5-V internal supply voltage
- In-circuit reconfigurability (ICR) via external configuration devices, intelligent controller, or JTAG port
- ClockLock™ and ClockBoost™ options for reduced clock delay/skew and clock multiplication
- Built-in low-skew clock distribution trees
- 100% functional testing of all devices; test vectors or scan chains are not required
- Pull-up on I/O pins before and during configuration
- Flexible interconnect
 - FastTrack® Interconnect continuous routing structure for fast, predictable interconnect delays
 - Dedicated carry chain that implements arithmetic functions such as fast adders, counters, and comparators (automatically used by software tools and megafunctions)
 - Dedicated cascade chain that implements high-speed, high-fan-in logic functions (automatically used by software tools and megafunctions)
 - Tri-state emulation that implements internal tri-state buses
 - Up to six global clock signals and four global clear signals
- Powerful I/O pins
 - Individual tri-state output enable control for each pin
 - Open-drain option on each I/O pin
 - Programmable output slew-rate control to reduce switching noise
 - Clamp to V_{CCIO} user-selectable on a pin-by-pin basis
 - Supports hot-socketing

- Software design support and automatic place-and-route provided by Altera's development systems for Windows-based PCs and Sun SPARCstation, and HP 9000 Series 700/800
- Flexible package options
 - Available in a variety of packages with 144 to 672 pins, including the innovative FineLine BGA™ packages (see [Tables 3 and 4](#))
 - SameFrame™ pin-out compatibility between FLEX 10KA and FLEX 10KE devices across a range of device densities and pin counts
- Additional design entry and simulation support provided by EDIF 2.0.0 and 3.0.0 netlist files, library of parameterized modules (LPM), DesignWare components, Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, Synplcity, VeriBest, and Viewlogic

Table 3. FLEX 10KE Package Options & I/O Pin Count *Notes (1), (2)*

| Device | 144-Pin TQFP | 208-Pin PQFP | 240-Pin PQFP RQFP | 256-Pin FineLine BGA | 356-Pin BGA | 484-Pin FineLine BGA | 599-Pin PGA | 600-Pin BGA | 672-Pin FineLine BGA |
|------------|-----------------|-----------------|-------------------------|----------------------------|----------------|----------------------------|----------------|----------------|----------------------------|
| EPF10K30E | 102 | 147 | | 176 | | 220 | | | 220 (3) |
| EPF10K50E | 102 | 147 | 189 | 191 | | 254 | | | 254 (3) |
| EPF10K50S | 102 | 147 | 189 | 191 | 220 | 254 | | | 254 (3) |
| EPF10K100E | | 147 | 189 | 191 | 274 | 338 | | | 338 (3) |
| EPF10K130E | | | 186 | | 274 | 369 | | 424 | 413 |
| EPF10K200E | | | | | | | 470 | 470 | 470 |
| EPF10K200S | | | 182 | | 274 | 369 | 470 | 470 | 470 |

Notes:

- (1) FLEX 10KE device package types include thin quad flat pack (TQFP), plastic quad flat pack (PQFP), power quad flat pack (RQFP), pin-grid array (PGA), and ball-grid array (BGA) packages.
- (2) Devices in the same package are pin-compatible, although some devices have more I/O pins than others. When planning device migration, use the I/O pins that are common to all devices.
- (3) This option is supported with a 484-pin FineLine BGA package. By using SameFrame pin migration, all FineLine BGA packages are pin-compatible. For example, a board can be designed to support 256-pin, 484-pin, and 672-pin FineLine BGA packages. The Altera software automatically avoids conflicting pins when future migration is set.

Similar to the FLEX 10KE architecture, embedded gate arrays are the fastest-growing segment of the gate array market. As with standard gate arrays, embedded gate arrays implement general logic in a conventional “sea-of-gates” architecture. Additionally, embedded gate arrays have dedicated die areas for implementing large, specialized functions. By embedding functions in silicon, embedded gate arrays reduce die area and increase speed when compared to standard gate arrays. While embedded megafunctions typically cannot be customized, FLEX 10KE devices are programmable, providing the designer with full control over embedded megafunctions and general logic, while facilitating iterative design changes during debugging.

Each FLEX 10KE device contains an embedded array and a logic array. The embedded array is used to implement a variety of memory functions or complex logic functions, such as digital signal processing (DSP), wide data-path manipulation, microcontroller applications, and data-transformation functions. The logic array performs the same function as the sea-of-gates in the gate array and is used to implement general logic such as counters, adders, state machines, and multiplexers. The combination of embedded and logic arrays provides the high performance and high density of embedded gate arrays, enabling designers to implement an entire system on a single device.

FLEX 10KE devices are configured at system power-up with data stored in an Altera serial configuration device or provided by a system controller. Altera offers the EPC1, EPC2, and EPC16 configuration devices, which configure FLEX 10KE devices via a serial data stream. Configuration data can also be downloaded from system RAM or via the Altera BitBlaster™, ByteBlasterMV™, or MasterBlaster download cables. After a FLEX 10KE device has been configured, it can be reconfigured in-circuit by resetting the device and loading new data. Because reconfiguration requires less than 85 ms, real-time changes can be made during system operation.

FLEX 10KE devices contain an interface that permits microprocessors to configure FLEX 10KE devices serially or in-parallel, and synchronously or asynchronously. The interface also enables microprocessors to treat a FLEX 10KE device as memory and configure it by writing to a virtual memory location, making it easy to reconfigure the device.

Figure 1 shows a block diagram of the FLEX 10KE architecture. Each group of LEs is combined into an LAB; groups of LABs are arranged into rows and columns. Each row also contains a single EAB. The LABs and EABs are interconnected by the FastTrack Interconnect routing structure. IOEs are located at the end of each row and column of the FastTrack Interconnect routing structure.

Figure 1. FLEX 10KE Device Block Diagram

FLEX 10KE devices provide six dedicated inputs that drive the flipflops' control inputs and ensure the efficient distribution of high-speed, low-skew (less than 1.5 ns) control signals. These signals use dedicated routing channels that provide shorter delays and lower skews than the FastTrack Interconnect routing structure. Four of the dedicated inputs drive four global signals. These four global signals can also be driven by internal logic, providing an ideal solution for a clock divider or an internally generated asynchronous clear signal that clears many registers in the device.

When used as RAM, each EAB can be configured in any of the following sizes: 256×16 , 512×8 , $1,024 \times 4$, or $2,048 \times 2$ (see [Figure 5](#)).

Figure 5. FLEX 10KE EAB Memory Configurations

Larger blocks of RAM are created by combining multiple EABs. For example, two 256×16 RAM blocks can be combined to form a 256×32 block; two 512×8 RAM blocks can be combined to form a 512×16 block (see [Figure 6](#)).

Figure 6. Examples of Combining FLEX 10KE EABs

If necessary, all EABs in a device can be cascaded to form a single RAM block. EABs can be cascaded to form RAM blocks of up to 2,048 words without impacting timing. The Altera software automatically combines EABs to meet a designer's RAM specifications.

The programmable flipflop in the LE can be configured for D, T, JK, or SR operation. The clock, clear, and preset control signals on the flipflop can be driven by global signals, general-purpose I/O pins, or any internal logic. For combinatorial functions, the flipflop is bypassed and the output of the LUT drives the output of the LE.

The LE has two outputs that drive the interconnect: one drives the local interconnect and the other drives either the row or column FastTrack Interconnect routing structure. The two outputs can be controlled independently. For example, the LUT can drive one output while the register drives the other output. This feature, called register packing, can improve LE utilization because the register and the LUT can be used for unrelated functions.

The FLEX 10KE architecture provides two types of dedicated high-speed data paths that connect adjacent LEs without using local interconnect paths: carry chains and cascade chains. The carry chain supports high-speed counters and adders and the cascade chain implements wide-input functions with minimum delay. Carry and cascade chains connect all LEs in a LAB as well as all LABs in the same row. Intensive use of carry and cascade chains can reduce routing flexibility. Therefore, the use of these chains should be limited to speed-critical portions of a design.

Carry Chain

The carry chain provides a very fast (as low as 0.2 ns) carry-forward function between LEs. The carry-in signal from a lower-order bit drives forward into the higher-order bit via the carry chain, and feeds into both the LUT and the next portion of the carry chain. This feature allows the FLEX 10KE architecture to implement high-speed counters, adders, and comparators of arbitrary width efficiently. Carry chain logic can be created automatically by the Altera Compiler during design processing, or manually by the designer during design entry. Parameterized functions such as LPM and DesignWare functions automatically take advantage of carry chains.

Carry chains longer than eight LEs are automatically implemented by linking LABs together. For enhanced fitting, a long carry chain skips alternate LABs in a row. A carry chain longer than one LAB skips either from even-numbered LAB to even-numbered LAB, or from odd-numbered LAB to odd-numbered LAB. For example, the last LE of the first LAB in a row carries to the first LE of the third LAB in the row. The carry chain does not cross the EAB at the middle of the row. For instance, in the EPF10K50E device, the carry chain stops at the eighteenth LAB and a new one begins at the nineteenth LAB.

FastTrack Interconnect Routing Structure

In the FLEX 10KE architecture, connections between LEs, EABs, and device I/O pins are provided by the FastTrack Interconnect routing structure, which is a series of continuous horizontal and vertical routing channels that traverses the device. This global routing structure provides predictable performance, even in complex designs. In contrast, the segmented routing in FPGAs requires switch matrices to connect a variable number of routing paths, increasing the delays between logic resources and reducing performance.

The FastTrack Interconnect routing structure consists of row and column interconnect channels that span the entire device. Each row of LABs is served by a dedicated row interconnect. The row interconnect can drive I/O pins and feed other LABs in the row. The column interconnect routes signals between rows and can drive I/O pins.

Row channels drive into the LAB or EAB local interconnect. The row signal is buffered at every LAB or EAB to reduce the effect of fan-out on delay. A row channel can be driven by an LE or by one of three column channels. These four signals feed dual 4-to-1 multiplexers that connect to two specific row channels. These multiplexers, which are connected to each LE, allow column channels to drive row channels even when all eight LEs in a LAB drive the row interconnect.

Each column of LABs or EABs is served by a dedicated column interconnect. The column interconnect that serves the EABs has twice as many channels as other column interconnects. The column interconnect can then drive I/O pins or another row's interconnect to route the signals to other LABs or EABs in the device. A signal from the column interconnect, which can be either the output of a LE or an input from an I/O pin, must be routed to the row interconnect before it can enter a LAB or EAB. Each row channel that is driven by an IOE or EAB can drive one specific column channel.

Access to row and column channels can be switched between LEs in adjacent pairs of LABs. For example, a LE in one LAB can drive the row and column channels normally driven by a particular LE in the adjacent LAB in the same row, and vice versa. This flexibility enables routing resources to be used more efficiently (see [Figure 13](#)).

Figure 14. FLEX 10KE Interconnect Resources

I/O Element

An IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data that requires a fast setup time, or as an output register for data that requires fast clock-to-output performance. In some cases, using an LE register for an input register will result in a faster setup time than using an IOE register. IOEs can be used as input, output, or bidirectional pins. For bidirectional registered I/O implementation, the output register should be in the IOE, and the data input and output enable registers should be LE registers placed adjacent to the bidirectional pin. The Altera Compiler uses the programmable inversion option to invert signals from the row and column interconnect automatically where appropriate. [Figure 15](#) shows the bidirectional I/O registers.

When dedicated inputs drive non-inverted and inverted peripheral clears, clock enables, and output enables, two signals on the peripheral control bus will be used.

Tables 8 and 9 list the sources for each peripheral control signal, and show how the output enable, clock enable, clock, and clear signals share 12 peripheral control signals. The tables also show the rows that can drive global signals.

Table 8. Peripheral Bus Sources for EPF10K30E, EPF10K50E & EPF10K50S Devices

| Peripheral Control Signal | EPF10K30E | EPF10K50E EPF10K50S |
|---------------------------|-----------|------------------------|
| OE0 | Row A | Row A |
| OE1 | Row B | Row B |
| OE2 | Row C | Row D |
| OE3 | Row D | Row F |
| OE4 | Row E | Row H |
| OE5 | Row F | Row J |
| CLKENA0/CLK0/GLOBAL0 | Row A | Row A |
| CLKENA1/OE6/GLOBAL1 | Row B | Row C |
| CLKENA2/CLR0 | Row C | Row E |
| CLKENA3/OE7/GLOBAL2 | Row D | Row G |
| CLKENA4/CLR1 | Row E | Row I |
| CLKENA5/CLK1/GLOBAL3 | Row F | Row J |

Table 13. ClockLock & ClockBoost Parameters for -2 Speed-Grade Devices

| Symbol | Parameter | Condition | Min | Typ | Max | Unit |
|----------------|---|----------------------|-----|-----|------------|------|
| t_R | Input rise time | | | | 5 | ns |
| t_F | Input fall time | | | | 5 | ns |
| t_{INDUTY} | Input duty cycle | | 40 | | 60 | % |
| f_{CLK1} | Input clock frequency (ClockBoost clock multiplication factor equals 1) | | 25 | | 75 | MHz |
| f_{CLK2} | Input clock frequency (ClockBoost clock multiplication factor equals 2) | | 16 | | 37.5 | MHz |
| f_{CLKDEV} | Input deviation from user specification in the MAX+PLUS II software (1) | | | | 25,000 (2) | PPM |
| $t_{INCLKSTB}$ | Input clock stability (measured between adjacent clocks) | | | | 100 | ps |
| t_{LOCK} | Time required for ClockLock or ClockBoost to acquire lock (3) | | | | 10 | μs |
| t_{JITTER} | Jitter on ClockLock or ClockBoost-generated clock (4) | $t_{INCLKSTB} < 100$ | | | 250 | ps |
| | | $t_{INCLKSTB} < 50$ | | | 200 (4) | ps |
| $t_{OUTDUTY}$ | Duty cycle for ClockLock or ClockBoost-generated clock | | 40 | 50 | 60 | % |

Notes to tables:

- (1) To implement the ClockLock and ClockBoost circuitry with the MAX+PLUS II software, designers must specify the input frequency. The Altera software tunes the PLL in the ClockLock and ClockBoost circuitry to this frequency. The f_{CLKDEV} parameter specifies how much the incoming clock can differ from the specified frequency during device operation. Simulation does not reflect this parameter.
- (2) Twenty-five thousand parts per million (PPM) equates to 2.5% of input clock period.
- (3) During device configuration, the ClockLock and ClockBoost circuitry is configured before the rest of the device. If the incoming clock is supplied during configuration, the ClockLock and ClockBoost circuitry locks during configuration because the t_{LOCK} value is less than the time required for configuration.
- (4) The t_{JITTER} specification is measured under long-term observation. The maximum value for t_{JITTER} is 200 ps if $t_{INCLKSTB}$ is lower than 50 ps.

I/O Configuration

This section discusses the peripheral component interconnect (PCI) pull-up clamping diode option, slew-rate control, open-drain output option, and MultiVolt I/O interface for FLEX 10KE devices. The PCI pull-up clamping diode, slew-rate control, and open-drain output options are controlled pin-by-pin via Altera software logic options. The MultiVolt I/O interface is controlled by connecting V_{CCIO} to a different voltage than V_{CCINT} . Its effect can be simulated in the Altera software via the **Global Project Device Options** dialog box (Assign menu).

Generic Testing

Each FLEX 10KE device is functionally tested. Complete testing of each configurable static random access memory (SRAM) bit and all logic functionality ensures 100% yield. AC test measurements for FLEX 10KE devices are made under conditions equivalent to those shown in [Figure 21](#). Multiple test patterns can be used to configure devices during all stages of the production flow.

Figure 21. FLEX 10KE AC Test Conditions

Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast-ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result. Numbers in brackets are for 2.5-V devices or outputs. Numbers without brackets are for 3.3-V devices or outputs.

Operating Conditions

[Tables 19](#) through [23](#) provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 2.5-V FLEX 10KE devices.

Table 19. FLEX 10KE 2.5-V Device Absolute Maximum Ratings *Note (1)*

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------|----------------------------|--|------|------|------|
| V_{CCINT} | Supply voltage | With respect to ground (2) | –0.5 | 3.6 | V |
| V_{CCIO} | | | –0.5 | 4.6 | V |
| V_I | DC input voltage | | –2.0 | 5.75 | V |
| I_{OUT} | DC output current, per pin | | –25 | 25 | mA |
| T_{STG} | Storage temperature | No bias | –65 | 150 | °C |
| T_{AMB} | Ambient temperature | Under bias | –65 | 135 | °C |
| T_J | Junction temperature | PQFP, TQFP, BGA, and FineLine BGA packages, under bias | | 135 | °C |
| | | Ceramic PGA packages, under bias | | 150 | °C |

Figure 25. FLEX 10KE Device LE Timing Model

Table 24. LE Timing Microparameters (Part 2 of 2) *Note (1)*

| Symbol | Parameter | Condition |
|-----------|--|-----------|
| t_{CLR} | LE register clear delay | |
| t_{CH} | Minimum clock high time from clock pin | |
| t_{CL} | Minimum clock low time from clock pin | |

Table 25. IOE Timing Microparameters *Note (1)*

| Symbol | Parameter | Conditions |
|--------------|---|----------------|
| t_{IOD} | IOE data delay | |
| t_{IOC} | IOE register control signal delay | |
| t_{IOCO} | IOE register clock-to-output delay | |
| t_{IOCOMB} | IOE combinatorial delay | |
| t_{IOSU} | IOE register setup time for data and enable signals before clock; IOE register recovery time after asynchronous clear | |
| t_{IOH} | IOE register hold time for data and enable signals after clock | |
| t_{IOCLR} | IOE register clear time | |
| t_{OD1} | Output buffer and pad delay, slow slew rate = off, $V_{CCIO} = 3.3\text{ V}$ | C1 = 35 pF (2) |
| t_{OD2} | Output buffer and pad delay, slow slew rate = off, $V_{CCIO} = 2.5\text{ V}$ | C1 = 35 pF (3) |
| t_{OD3} | Output buffer and pad delay, slow slew rate = on | C1 = 35 pF (4) |
| t_{XZ} | IOE output buffer disable delay | |
| t_{ZX1} | IOE output buffer enable delay, slow slew rate = off, $V_{CCIO} = 3.3\text{ V}$ | C1 = 35 pF (2) |
| t_{ZX2} | IOE output buffer enable delay, slow slew rate = off, $V_{CCIO} = 2.5\text{ V}$ | C1 = 35 pF (3) |
| t_{ZX3} | IOE output buffer enable delay, slow slew rate = on | C1 = 35 pF (4) |
| t_{INREG} | IOE input pad and buffer to IOE register delay | |
| t_{IOFD} | IOE register feedback delay | |
| t_{INCOMB} | IOE input pad and buffer to FastTrack Interconnect delay | |

Table 37. EPF10K30E External Bidirectional Timing Parameters *Notes (1), (2)*

Notes to tables:

- (1) All timing parameters are described in Tables 24 through 30 in this data sheet.
 (2) This parameter is measured without the use of the ClockLock or ClockBoost circuits.
 (3) This parameter is measured with the use of the ClockLock or ClockBoost circuits.
