Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

| | |
|--------------------------------|---|
| Product Status | Obsolete |
| Number of LABs/CLBs | 360 |
| Number of Logic Elements/Cells | 2880 |
| Total RAM Bits | 40960 |
| Number of I/O | 147 |
| Number of Gates | 199000 |
| Voltage - Supply | 2.3V ~ 2.7V |
| Mounting Type | Surface Mount |
| Operating Temperature | -40°C ~ 85°C (TA) |
| Package / Case | 208-BFQFP |
| Supplier Device Package | 208-PQFP (28x28) |
| Purchase URL | https://www.e-xfl.com/product-detail/intel/epf10k50eqi208-3 |

Table 2. FLEX 10KE Device Features

| Feature | EPF10K100E (2) | EPF10K130E | EPF10K200E EPF10K200S |
|-----------------------|----------------|------------|--------------------------|
| Typical gates (1) | 100,000 | 130,000 | 200,000 |
| Maximum system gates | 257,000 | 342,000 | 513,000 |
| Logic elements (LEs) | 4,992 | 6,656 | 9,984 |
| EABs | 12 | 16 | 24 |
| Total RAM bits | 49,152 | 65,536 | 98,304 |
| Maximum user I/O pins | 338 | 413 | 470 |

Note to tables:

- (1) The embedded IEEE Std. 1149.1 JTAG circuitry adds up to 31,250 gates in addition to the listed typical or maximum system gates.
- (2) New EPF10K100B designs should use EPF10K100E devices.

...and More Features

- Fabricated on an advanced process and operate with a 2.5-V internal supply voltage
- In-circuit reconfigurability (ICR) via external configuration devices, intelligent controller, or JTAG port
- ClockLock™ and ClockBoost™ options for reduced clock delay/skew and clock multiplication
- Built-in low-skew clock distribution trees
- 100% functional testing of all devices; test vectors or scan chains are not required
- Pull-up on I/O pins before and during configuration
- Flexible interconnect
 - FastTrack® Interconnect continuous routing structure for fast, predictable interconnect delays
 - Dedicated carry chain that implements arithmetic functions such as fast adders, counters, and comparators (automatically used by software tools and megafunctions)
 - Dedicated cascade chain that implements high-speed, high-fan-in logic functions (automatically used by software tools and megafunctions)
 - Tri-state emulation that implements internal tri-state buses
 - Up to six global clock signals and four global clear signals
- Powerful I/O pins
 - Individual tri-state output enable control for each pin
 - Open-drain option on each I/O pin
 - Programmable output slew-rate control to reduce switching noise
 - Clamp to V_{CCIO} user-selectable on a pin-by-pin basis
 - Supports hot-socketing

- Software design support and automatic place-and-route provided by Altera's development systems for Windows-based PCs and Sun SPARCstation, and HP 9000 Series 700/800
- Flexible package options
 - Available in a variety of packages with 144 to 672 pins, including the innovative FineLine BGA™ packages (see [Tables 3 and 4](#))
 - SameFrame™ pin-out compatibility between FLEX 10KA and FLEX 10KE devices across a range of device densities and pin counts
- Additional design entry and simulation support provided by EDIF 2.0.0 and 3.0.0 netlist files, library of parameterized modules (LPM), DesignWare components, Verilog HDL, VHDL, and other interfaces to popular EDA tools from manufacturers such as Cadence, Exemplar Logic, Mentor Graphics, OrCAD, Synopsys, Synplcity, VeriBest, and Viewlogic

Table 3. FLEX 10KE Package Options & I/O Pin Count *Notes (1), (2)*

| Device | 144-Pin TQFP | 208-Pin PQFP | 240-Pin PQFP RQFP | 256-Pin FineLine BGA | 356-Pin BGA | 484-Pin FineLine BGA | 599-Pin PGA | 600-Pin BGA | 672-Pin FineLine BGA |
|------------|-----------------|-----------------|-------------------------|----------------------------|----------------|----------------------------|----------------|----------------|----------------------------|
| EPF10K30E | 102 | 147 | | 176 | | 220 | | | 220 (3) |
| EPF10K50E | 102 | 147 | 189 | 191 | | 254 | | | 254 (3) |
| EPF10K50S | 102 | 147 | 189 | 191 | 220 | 254 | | | 254 (3) |
| EPF10K100E | | 147 | 189 | 191 | 274 | 338 | | | 338 (3) |
| EPF10K130E | | | 186 | | 274 | 369 | | 424 | 413 |
| EPF10K200E | | | | | | | 470 | 470 | 470 |
| EPF10K200S | | | 182 | | 274 | 369 | 470 | 470 | 470 |

Notes:

- (1) FLEX 10KE device package types include thin quad flat pack (TQFP), plastic quad flat pack (PQFP), power quad flat pack (RQFP), pin-grid array (PGA), and ball-grid array (BGA) packages.
- (2) Devices in the same package are pin-compatible, although some devices have more I/O pins than others. When planning device migration, use the I/O pins that are common to all devices.
- (3) This option is supported with a 484-pin FineLine BGA package. By using SameFrame pin migration, all FineLine BGA packages are pin-compatible. For example, a board can be designed to support 256-pin, 484-pin, and 672-pin FineLine BGA packages. The Altera software automatically avoids conflicting pins when future migration is set.

Table 5. FLEX 10KE Performance

| Application | Resources Used | | Performance | | | Units |
|---|----------------|------|----------------|----------------|----------------|-------|
| | LEs | EABs | -1 Speed Grade | -2 Speed Grade | -3 Speed Grade | |
| 16-bit loadable counter | 16 | 0 | 285 | 250 | 200 | MHz |
| 16-bit accumulator | 16 | 0 | 285 | 250 | 200 | MHz |
| 16-to-1 multiplexer (1) | 10 | 0 | 3.5 | 4.9 | 7.0 | ns |
| 16-bit multiplier with 3-stage pipeline (2) | 592 | 0 | 156 | 131 | 93 | MHz |
| 256 × 16 RAM read cycle speed (2) | 0 | 1 | 196 | 154 | 118 | MHz |
| 256 × 16 RAM write cycle speed (2) | 0 | 1 | 185 | 143 | 106 | MHz |

Notes:

- (1) This application uses combinatorial inputs and outputs.
 (2) This application uses registered inputs and outputs.

Table 6 shows FLEX 10KE performance for more complex designs. These designs are available as Altera MegaCore® functions.

Table 6. FLEX 10KE Performance for Complex Designs

| Application | LEs Used | Performance | | | Units |
|---|----------|----------------|----------------|----------------|--------|
| | | -1 Speed Grade | -2 Speed Grade | -3 Speed Grade | |
| 8-bit, 16-tap parallel finite impulse response (FIR) filter | 597 | 192 | 156 | 116 | MSPS |
| 8-bit, 512-point fast Fourier transform (FFT) function | 1,854 | 23.4 | 28.7 | 38.9 | μs (1) |
| | | 113 | 92 | 68 | MHz |
| a16450 universal asynchronous receiver/transmitter (UART) | 342 | 36 | 28 | 20.5 | MHz |

Note:

- (1) These values are for calculation time. Calculation time = number of clocks required / f_{\max} . Number of clocks required = ceiling $[\log_2 (\text{points})/2] \times [\text{points} + 14 + \text{ceiling}]$

The EAB can also use Altera megafunctions to implement dual-port RAM applications where both ports can read or write, as shown in [Figure 3](#).

Figure 3. FLEX 10KE EAB in Dual-Port RAM Mode

The FLEX 10KE EAB can be used in a single-port mode, which is useful for backward-compatibility with FLEX 10K designs (see [Figure 4](#)).

EABs provide flexible options for driving and controlling clock signals. Different clocks and clock enables can be used for reading and writing to the EAB. Registers can be independently inserted on the data input, EAB output, write address, write enable signals, read address, and read enable signals. The global signals and the EAB local interconnect can drive write enable, read enable, and clock enable signals. The global signals, dedicated clock pins, and EAB local interconnect can drive the EAB clock signals. Because the LEs drive the EAB local interconnect, the LEs can control write enable, read enable, clear, clock, and clock enable signals.

An EAB is fed by a row interconnect and can drive out to row and column interconnects. Each EAB output can drive up to two row channels and up to two column channels; the unused row channel can be driven by other LEs. This feature increases the routing resources available for EAB outputs (see [Figures 2 and 4](#)). The column interconnect, which is adjacent to the EAB, has twice as many channels as other columns in the device.

Logic Array Block

An LAB consists of eight LEs, their associated carry and cascade chains, LAB control signals, and the LAB local interconnect. The LAB provides the coarse-grained structure to the FLEX 10KE architecture, facilitating efficient routing with optimum device utilization and high performance (see [Figure 7](#)).

In addition to the six clear and preset modes, FLEX 10KE devices provide a chip-wide reset pin that can reset all registers in the device. Use of this feature is set during design entry. In any of the clear and preset modes, the chip-wide reset overrides all other signals. Registers with asynchronous presets may be preset when the chip-wide reset is asserted. Inversion can be used to implement the asynchronous preset. Figure 12 shows examples of how to setup the preset and clear inputs for the desired functionality.

Figure 12. FLEX 10KE LE Clear & Preset Modes

Asynchronous Clear

Asynchronous Preset

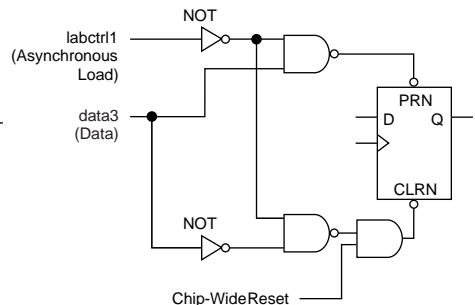

Asynchronous Preset & Clear

Asynchronous Load with Clear

Asynchronous Load without Clear or Preset

Asynchronous Load with Preset

Asynchronous Clear

The flipflop can be cleared by either LABCTRL1 or LABCTRL2. In this mode, the preset signal is tied to VCC to deactivate it.

Asynchronous Preset

An asynchronous preset is implemented as an asynchronous load, or with an asynchronous clear. If DATA3 is tied to VCC, asserting LABCTRL1 asynchronously loads a one into the register. Alternatively, the Altera software can provide preset control by using the clear and inverting the input and output of the register. Inversion control is available for the inputs to both LEs and IOEs. Therefore, if a register is preset by only one of the two LABCTRL signals, the DATA3 input is not needed and can be used for one of the LE operating modes.

Asynchronous Preset & Clear

When implementing asynchronous clear and preset, LABCTRL1 controls the preset and LABCTRL2 controls the clear. DATA3 is tied to VCC, so that asserting LABCTRL1 asynchronously loads a one into the register, effectively presetting the register. Asserting LABCTRL2 clears the register.

Asynchronous Load with Clear

When implementing an asynchronous load in conjunction with the clear, LABCTRL1 implements the asynchronous load of DATA3 by controlling the register preset and clear. LABCTRL2 implements the clear by controlling the register clear; LABCTRL2 does not have to feed the preset circuits.

Asynchronous Load with Preset

When implementing an asynchronous load in conjunction with preset, the Altera software provides preset control by using the clear and inverting the input and output of the register. Asserting LABCTRL2 presets the register, while asserting LABCTRL1 loads the register. The Altera software inverts the signal that drives DATA3 to account for the inversion of the register's output.

Asynchronous Load without Preset or Clear

When implementing an asynchronous load without preset or clear, LABCTRL1 implements the asynchronous load of DATA3 by controlling the register preset and clear.

Figure 13. FLEX 10KE LAB Connections to Row & Column Interconnect

Figure 14. FLEX 10KE Interconnect Resources

I/O Element

An IOE contains a bidirectional I/O buffer and a register that can be used either as an input register for external data that requires a fast setup time, or as an output register for data that requires fast clock-to-output performance. In some cases, using an LE register for an input register will result in a faster setup time than using an IOE register. IOEs can be used as input, output, or bidirectional pins. For bidirectional registered I/O implementation, the output register should be in the IOE, and the data input and output enable registers should be LE registers placed adjacent to the bidirectional pin. The Altera Compiler uses the programmable inversion option to invert signals from the row and column interconnect automatically where appropriate. [Figure 15](#) shows the bidirectional I/O registers.

ClockLock & ClockBoost Timing Parameters

For the ClockLock and ClockBoost circuitry to function properly, the incoming clock must meet certain requirements. If these specifications are not met, the circuitry may not lock onto the incoming clock, which generates an erroneous clock within the device. The clock generated by the ClockLock and ClockBoost circuitry must also meet certain specifications. If the incoming clock meets these requirements during configuration, the ClockLock and ClockBoost circuitry will lock onto the clock during configuration. The circuit will be ready for use immediately after configuration. Figure 19 shows the incoming and generated clock specifications.

Figure 19. Specifications for Incoming & Generated Clocks

The t_I parameter refers to the nominal input clock period; the t_O parameter refers to the nominal output clock period.

PCI Pull-Up Clamping Diode Option

FLEX 10KE devices have a pull-up clamping diode on every I/O, dedicated input, and dedicated clock pin. PCI clamping diodes clamp the signal to the V_{CCIO} value and are required for 3.3-V PCI compliance. Clamping diodes can also be used to limit overshoot in other systems.

Clamping diodes are controlled on a pin-by-pin basis. When V_{CCIO} is 3.3 V, a pin that has the clamping diode option turned on can be driven by a 2.5-V or 3.3-V signal, but not a 5.0-V signal. When V_{CCIO} is 2.5 V, a pin that has the clamping diode option turned on can be driven by a 2.5-V signal, but not a 3.3-V or 5.0-V signal. Additionally, a clamping diode can be activated for a subset of pins, which would allow a device to bridge between a 3.3-V PCI bus and a 5.0-V device.

Slew-Rate Control

The output buffer in each IOE has an adjustable output slew rate that can be configured for low-noise or high-speed performance. A slower slew rate reduces system noise and adds a maximum delay of 4.3 ns. The fast slew rate should be used for speed-critical outputs in systems that are adequately protected against noise. Designers can specify the slew rate pin-by-pin or assign a default slew rate to all pins on a device-wide basis. The slow slew rate setting affects the falling edge of the output.

Open-Drain Output Option

FLEX 10KE devices provide an optional open-drain output (electrically equivalent to open-collector output) for each I/O pin. This open-drain output enables the device to provide system-level control signals (e.g., interrupt and write enable signals) that can be asserted by any of several devices. It can also provide an additional wired-OR plane.

MultiVolt I/O Interface

The FLEX 10KE device architecture supports the MultiVolt I/O interface feature, which allows FLEX 10KE devices in all packages to interface with systems of differing supply voltages. These devices have one set of V_{CC} pins for internal operation and input buffers (V_{CCINT}), and another set for I/O output drivers (V_{CCIO}).

Generic Testing

Each FLEX 10KE device is functionally tested. Complete testing of each configurable static random access memory (SRAM) bit and all logic functionality ensures 100% yield. AC test measurements for FLEX 10KE devices are made under conditions equivalent to those shown in [Figure 21](#). Multiple test patterns can be used to configure devices during all stages of the production flow.

Figure 21. FLEX 10KE AC Test Conditions

Power supply transients can affect AC measurements. Simultaneous transitions of multiple outputs should be avoided for accurate measurement. Threshold tests must not be performed under AC conditions. Large-amplitude, fast-ground-current transients normally occur as the device outputs discharge the load capacitances. When these transients flow through the parasitic inductance between the device ground pin and the test system ground, significant reductions in observable noise immunity can result. Numbers in brackets are for 2.5-V devices or outputs. Numbers without brackets are for 3.3-V devices or outputs.

Operating Conditions

[Tables 19](#) through [23](#) provide information on absolute maximum ratings, recommended operating conditions, DC operating conditions, and capacitance for 2.5-V FLEX 10KE devices.

Table 19. FLEX 10KE 2.5-V Device Absolute Maximum Ratings *Note (1)*

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------|----------------------------|--|------|------|------|
| V_{CCINT} | Supply voltage | With respect to ground (2) | –0.5 | 3.6 | V |
| V_{CCIO} | | | –0.5 | 4.6 | V |
| V_I | DC input voltage | | –2.0 | 5.75 | V |
| I_{OUT} | DC output current, per pin | | –25 | 25 | mA |
| T_{STG} | Storage temperature | No bias | –65 | 150 | °C |
| T_{AMB} | Ambient temperature | Under bias | –65 | 135 | °C |
| T_J | Junction temperature | PQFP, TQFP, BGA, and FineLine BGA packages, under bias | | 135 | °C |
| | | Ceramic PGA packages, under bias | | 150 | °C |

Notes to tables:

- (1) All timing parameters are described in Tables 24 through 30 in this data sheet.
 (2) These parameters are specified by characterization.

Tables 45 through 51 show EPF10K100E device internal and external timing parameters.

Table 45. EPF10K100E Device LE Timing Microparameters Note (1)

| Symbol | -1 Speed Grade | | -2 Speed Grade | | -3 Speed Grade | | Unit |
|---------------------|----------------|-----|----------------|-----|----------------|-----|------|
| | Min | Max | Min | Max | Min | Max | |
| t_{LUT} | | 0.7 | | 1.0 | | 1.5 | ns |
| t_{CLUT} | | 0.5 | | 0.7 | | 0.9 | ns |
| t_{RLUT} | | 0.6 | | 0.8 | | 1.1 | ns |
| t_{PACKED} | | 0.3 | | 0.4 | | 0.5 | ns |
| t_{EN} | | 0.2 | | 0.3 | | 0.3 | ns |
| t_{CICO} | | 0.1 | | 0.1 | | 0.2 | ns |
| t_{CGEN} | | 0.4 | | 0.5 | | 0.7 | ns |

Table 53. EPF10K130E Device IOE Timing Microparameters *Note (1)*

| Symbol | -1 Speed Grade | | -2 Speed Grade | | -3 Speed Grade | | Unit |
|--------------|----------------|-----|----------------|-----|----------------|-----|------|
| | Min | Max | Min | Max | Min | Max | |
| t_{OD3} | | 4.0 | | 5.6 | | 7.5 | ns |
| t_{XZ} | | 2.8 | | 4.1 | | 5.5 | ns |
| t_{ZX1} | | 2.8 | | 4.1 | | 5.5 | ns |
| t_{ZX2} | | 2.8 | | 4.1 | | 5.5 | ns |
| t_{ZX3} | | 4.0 | | 5.6 | | 7.5 | ns |
| t_{INREG} | | 2.5 | | 3.0 | | 4.1 | ns |
| t_{IOFD} | | 0.4 | | 0.5 | | 0.6 | ns |
| t_{INCOMB} | | 0.4 | | 0.5 | | 0.6 | ns |

Table 54. EPF10K130E Device EAB Internal Microparameters (Part 1 of 2) *Note (1)*

| Symbol | -1 Speed Grade | | -2 Speed Grade | | -3 Speed Grade | | Unit |
|----------------|----------------|-----|----------------|-----|----------------|-----|------|
| | Min | Max | Min | Max | Min | Max | |
| $t_{EABDATA1}$ | | 1.5 | | 2.0 | | 2.6 | ns |
| $t_{EABDATA2}$ | | 0.0 | | 0.0 | | 0.0 | ns |
| t_{EABWE1} | | 1.5 | | 2.0 | | 2.6 | ns |
| t_{EABWE2} | | 0.3 | | 0.4 | | 0.5 | ns |
