

Welcome to [E-XFL.COM](#)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	34
Number of Gates	30000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	48-VFQFN Exposed Pad
Supplier Device Package	48-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p030-1qng48

1 – ProASIC3 Device Family Overview

General Description

ProASIC3, the third-generation family of Microsemi flash FPGAs, offers performance, density, and features beyond those of the ProASIC^{PLUS®} family. Nonvolatile flash technology gives ProASIC3 devices the advantage of being a secure, low power, single-chip solution that is Instant On. ProASIC3 is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost. These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

ProASIC3 devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). The A3P015 and A3P030 devices have no PLL or RAM support. ProASIC3 devices have up to 1 million system gates, supported with up to 144 kbits of true dual-port SRAM and up to 300 user I/Os.

ProASIC3 devices support the ARM Cortex-M1 processor. The ARM-enabled devices have Microsemi ordering numbers that begin with M1A3P (Cortex-M1) and do not support AES decryption.

Flash Advantages

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based ProASIC3 devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property (IP) cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The ProASIC3 family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the ProASIC3 family a cost-effective ASIC replacement solution, especially for applications in the consumer, networking/ communications, computing, and avionics markets.

Security

The nonvolatile, flash-based ProASIC3 devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. ProASIC3 devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

ProASIC3 devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in ProASIC3 devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. The AES standard was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. ProASIC3 devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. ProASIC3 devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

ARM-enabled ProASIC3 devices do not support user-controlled AES security mechanisms. Since the ARM core must be protected at all times, AES encryption is always on for the core logic, so bitstreams are always encrypted. There is no user access to encryption for the FlashROM programming data.

Security, built into the FPGA fabric, is an inherent component of the ProASIC3 family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The ProASIC3 family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks.

2 – ProASIC3 DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2](#) on page 2-2 is not implied.

Table 2-1 • Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI	DC I/O output buffer supply voltage	–0.3 to 3.75	V
VMV	DC I/O input buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T _{STG} ²	Storage temperature	–65 to +150	°C
T _J ²	Junction temperature	+125	°C

Notes:

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-4](#) on page 2-3.
2. VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on [page 3-1](#) for further information.
3. For flash programming and retention maximum limits, refer to [Table 2-3](#) on page 2-3, and for recommended operating limits, refer to [Table 2-2](#) on page 2-2.

**Table 2-32 • I/O Short Currents IOSH/IOSL
Applicable to Advanced I/O Banks**

	Drive Strength	IOSL (mA) ¹	IOSH (mA) ¹
3.3 V LVTTL / 3.3 V LVCMOS	2 mA	27	25

3.3 V PCI/PCI-X	Per PCI/PCI-X specification	109	103

Notes:

1. $T_J = 100^\circ\text{C}$
2. Applicable to 3.3 V LVCMOS Wide Range. I_{OSL}/I_{OSH} dependent on the I/O buffer drive strength selected for wide range applications. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.

**Table 2-49 • Minimum and Maximum DC Input and Output Levels
Applicable to Standard I/O Banks**

3.3 V LVC MOS Wide Range	Equiv. Software Default Drive Strength Option ¹	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL ²	IIH ³
		Min V	Max V	Min V	Max V	Max V	Min V	μA	μA	Max mA ⁴	Max mA ⁴	μA ⁵	μA ⁵
100 μA	2 mA	-0.3	0.8	2	3.6	0.2	VDD - 0.2	100	100	25	27	10	10
100 μA	4 mA	-0.3	0.8	2	3.6	0.2	VDD - 0.2	100	100	25	27	10	10
100 μA	6 mA	-0.3	0.8	2	3.6	0.2	VDD - 0.2	100	100	51	54	10	10
100 μA	8 mA	-0.3	0.8	2	3.6	0.2	VDD - 0.2	100	100	51	54	10	10

Notes:

1. The minimum drive strength for any LVC MOS 3.3 V software configuration when run in wide range is ±100 μA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. IIL is the input leakage current per I/O pin over recommended operation conditions where -0.3 V < VIN < VIL.
3. IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges
4. Currents are measured at 85°C junction temperature.
5. All LVMCOS 3.3 V software macros support LVC MOS 3.3 V wide range as specified in the JESD8-B specification.
6. Software default selection highlighted in gray.

		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.87	1.09	0.99	1.24	1.17	1.46	ns
t_{RCKH}	Input High Delay for Global Clock	0.86	1.11	0.98	1.27	1.15	1.49	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.75		0.85		1.00		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.85		0.96		1.13		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.29		0.34	ns

Notes:

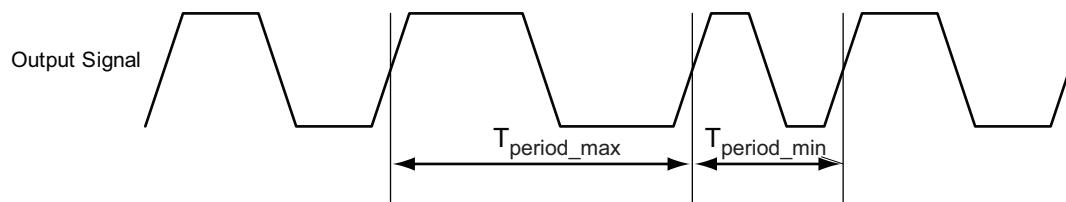

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-6](#) for derating values.

Table 2-114 • A3P1000 Global Resource
 Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $VCC = 1.425 \text{ V}$

Parameter	Description	-2		-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.94	1.16	1.07	1.32	1.26	1.55	ns
t_{RCKH}	Input High Delay for Global Clock	0.93	1.19	1.06	1.35	1.24	1.59	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.75		0.85		1.00		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.85		0.96		1.13		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.29		0.35	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-6](#) for derating values.

Note: Peak-to-peak jitter measurements are defined by $T_{peak-to-peak} = T_{period_max} - T_{period_min}$.

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "ProASIC3 Device Status" table on page IV, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Unmarked (production)

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
