
Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	77
Number of Gates	30000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p030-2vqg100i

Notes:
1. *When considering migrating your design to a lower- or higher-density device, refer to the ProASIC3 FPGA Fabric User Guide to ensure complying with design and board migration requirements.*
2. *A3P015 is not recommended for new designs.*
3. *For A3P250 and A3P400 devices, the maximum number of LVPECL pairs in east and west banks cannot exceed 15. Refer to the ProASIC3 FPGA Fabric Users Guide for position assignments of the 15 LVPECL pairs.*
4. *Each used differential I/O pair reduces the number of single-ended I/Os available by two.*
5. *The M1A3P250 device does not support FG256 package.*
6. *FG256 and FG484 are footprint-compatible packages.*
7. *Package not available.*

I/Os with Advanced I/O Standards

The ProASIC3 family of FPGAs features a flexible I/O structure, supporting a range of voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V). ProASIC3 FPGAs support many different I/O standards—single-ended and differential.

The I/Os are organized into banks, with two or four banks per device. The configuration of these banks determines the I/O standards supported (Table 1-1).

Table 1-1 • **I/O Standards Supported**

I/O Bank Type	Device and Bank Location	I/O Standards Supported		
		LVTTL/ LVCMOS	PCI/PCI-X	LVPECL, LVDS, B-LVDS, M-LVDS
Advanced	East and west Banks of A3P250 and larger devices	✓	✓	✓
Standard Plus	North and south banks of A3P250 and larger devices All banks of A3P060 and A3P125	✓	✓	Not supported
Standard	All banks of A3P015 and A3P030	✓	Not supported	Not supported

Each I/O module contains several input, output, and enable registers. These registers allow the implementation of the following:

- Single-Data-Rate applications
- Double-Data-Rate applications—DDR LVDS, B-LVDS, and M-LVDS I/Os for point-to-point communications

ProASIC3 banks for the A3P250 device and above support LVPECL, LVDS, B-LVDS and M-LVDS. B-LVDS and M-LVDS can support up to 20 loads.

Hot-swap (also called hot-plug, or hot-insertion) is the operation of hot-insertion or hot-removal of a card in a powered-up system.

Cold-sparing (also called cold-swap) refers to the ability of a device to leave system data undisturbed when the system is powered up, while the component itself is powered down, or when power supplies are floating.

Wide Range I/O Support

ProASIC3 devices support JEDEC-defined wide range I/O operation. ProASIC3 supports the JESD8-B specification, covering both 3 V and 3.3 V supplies, for an effective operating range of 2.7 V to 3.6 V.

Wider I/O range means designers can eliminate power supplies or power conditioning components from the board or move to less costly components with greater tolerances. Wide range eases I/O bank management and provides enhanced protection from system voltage spikes, while providing the flexibility to easily run custom voltage applications.

Specifying I/O States During Programming

You can modify the I/O states during programming in FlashPro. In FlashPro, this feature is supported for PDB files generated from Designer v8.5 or greater. See the *FlashPro User's Guide* for more information.

Note: PDB files generated from Designer v8.1 to Designer v8.4 (including all service packs) have limited display of Pin Numbers only.

1. Load a PDB from the FlashPro GUI. You must have a PDB loaded to modify the I/O states during programming.
2. From the FlashPro GUI, click PDB Configuration. A FlashPoint – Programming File Generator window appears.
3. Click the Specify I/O States During Programming button to display the Specify I/O States During Programming dialog box.
4. Sort the pins as desired by clicking any of the column headers to sort the entries by that header. Select the I/Os you wish to modify (Figure 1-4 on page 1-8).
5. Set the I/O Output State. You can set Basic I/O settings if you want to use the default I/O settings for your pins, or use Custom I/O settings to customize the settings for each pin. Basic I/O state settings:

   1 – I/O is set to drive out logic High

3.3 V LVCMOS Wide Range

Table 2-47 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

1.8 V LVCMOS

Low-voltage CMOS for 1.8 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.8 V applications. It uses a 1.8 V input buffer and a push-pull output buffer.

Table 2-66 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

Revision	Changes	Page
Revision 11 (March 2012)	Note indicating that A3P015 is not recommended for new designs has been added. The "Devices Not Recommended For New Designs" section is new (SAR 36760).	I to IV
	The following sentence was removed from the Advanced Architecture section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOO devices via an IEEE 1532 JTAG interface" (SAR 34687).	NA
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—PCLOCK" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3 FPGA Fabric User's Guide* (SAR 34734).	2-12
	Figure 2-4 • Input Buffer Timing Model and Delays (Example) has been modified for the DIN waveform; the Rise and Fall time label has been changed to tDIN (35430).	2-16
	The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34883).	2-32
	Added values for minimum pulse width and removed the FRMAX row from Table 2-107 through Table 2-114 in the "Global Tree Timing Characteristics" section. Use the software to determine the FRMAX for the device you are using (SARs 37279, 29269).	2-85
