Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

0°C	> 20 years

Table 2-36 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min)	Input Rise/Fall Time (max)	Reliability
LVTTL/LVCMOS	No requirement	10 ns *	20 years (110°C)
LVDS/B-LVDS/ M-LVDS/LVPECL	No requirement	10 ns *	10 years (100°C)

*Note: *The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.*

B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-13. The input and output buffer delays are available in the LVDS section in Table 2-92.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: R_S = 60 Ω and R_T = 70 Ω, given Z_0 = 50 Ω (2") and Z_{stub} = 50 Ω (~1.5").

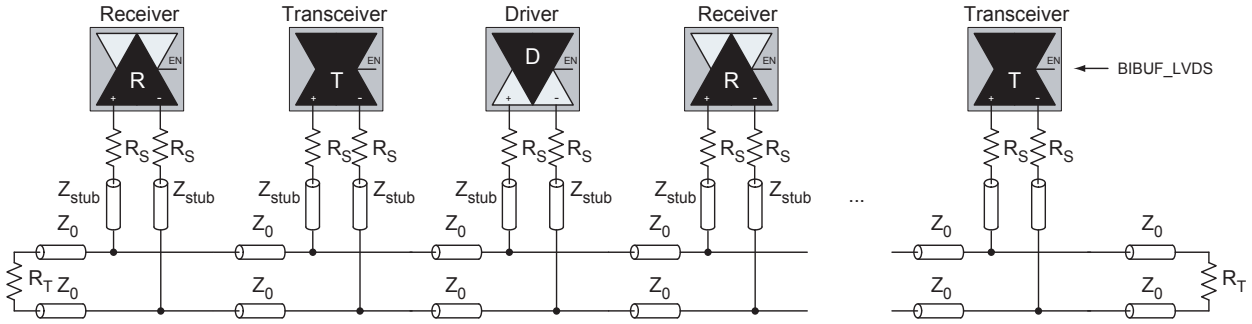

Figure 2-13 • **B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-14. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

VersaTile Specifications as a Sequential Module

The ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *Fusion, IGLOO/e, and ProASIC3/E Macro Library Guide*.

Global Resource Characteristics

A3P250 Clock Tree Topology

Clock delays are device-specific. Figure 2-28 is an example of a global tree used for clock routing. The global tree presented in Figure 2-28 is driven by a CCC located on the west side of the A3P250 device. It is used to drive all D-flip-flops in the device.

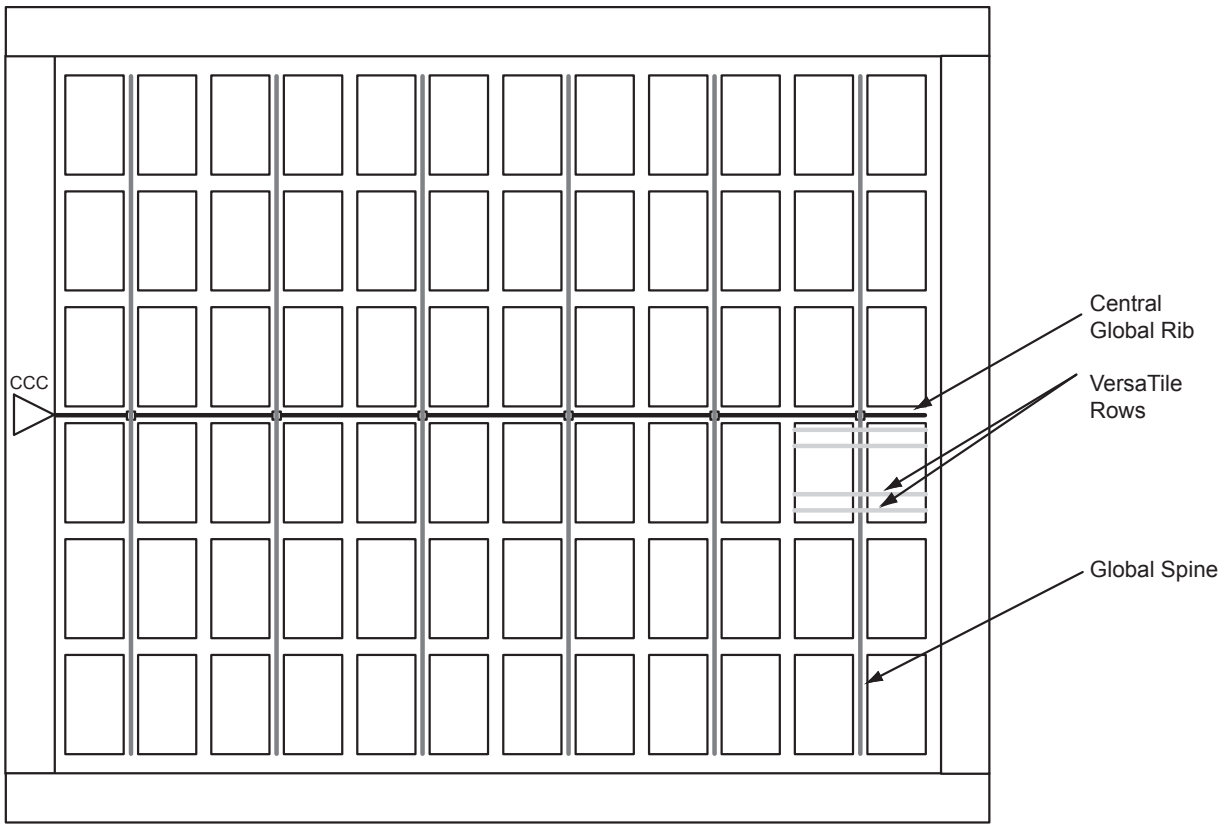

Figure 2-28 • **Example of Global Tree Use in an A3P250 Device for Clock Routing**

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-90. Table 2-108 to Table 2-114 on page 2-89 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Revision	Changes	Page
Revision 13 (January 2013)	The "ProASIC3 Ordering Information" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43104).	1-IV
	Added a note to Table 2-2 • Recommended Operating Conditions 1 (SAR 43644): The programming temperature range supported is $T_{ambient}$ = 0°C to 85°C.	2-2
	The note in Table 2-115 • ProASIC3 CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42569).	2-90
	Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40284). Live at Power-Up (LAPU) has been replaced with 'Instant On'.	NA
Revision 12 (September 2012)	The Security section was modified to clarify that Microsemi does not support read-back of programmed data.	1-1
	Added a Note stating "VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information" to Table 2-1 • Absolute Maximum Ratings and Table 2-2 • Recommended Operating Conditions 1 (SAR 38321).	2-1 2-2
	Table 2-35 • Duration of Short Circuit Event Before Failure was revised to change the maximum temperature from 110°C to 100°C, with an example of six months instead of three months (SAR 37933).	2-31
	In Table 2-93 • Minimum and Maximum DC Input and Output Levels, VIL and VIH were revised so that the maximum is 3.6 V for all listed values of VCCI (SAR 28549).	2-68
	Figure 2-37 • FIFO Read and Figure 2-38 • FIFO Write are new (SAR 28371).	2-99
	The following sentence was removed from the "VMVx I/O Supply Voltage (quiet)" section in the "Pin Descriptions" chapter: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with "Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks" (SAR 38321). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement.	3-1

Revision 5 (Aug 2008) DC and Switching Characteristics v1.3	TJ, Maximum Junction Temperature, was changed to 100° from 110º in the "Thermal Characteristics" section and EQ 1. The calculated result of Maximum Power Allowed has thus changed to 1.463 W from 1.951 W.	2-6
	Values for the A3P015 device were added to Table 2-7 • Quiescent Supply Current Characteristics.	2-7
	Values for the A3P015 device were added to Table 2-14 • Different Components Contributing to Dynamic Power Consumption in ProASIC3 Devices. P_{AC14} was removed. Table 2-15 • Different Components Contributing to the Static Power Consumption in ProASIC3 Devices is new.	2-11, 2-12
	The "PLL Contribution—PPLL" section was updated to change the P_{PLL} formula from $P_{AC13} + P_{AC14} * F_{CLKOUT}$ to $P_{DC4} + P_{AC13} * F_{CLKOUT}$.	2-14
	Both fall and rise values were included for $t_{DDRISUD}$ and t_{DDRIHD} in Table 2-102 • Input DDR Propagation Delays.	2-78
	Table 2-107 • A3P015 Global Resource is new.	2-86
	The typical value for Delay Increments in Programmable Delay Blocks was changed from 160 to 200 in Table 2-115 • ProASIC3 CCC/PLL Specification.	2-90
Revision 4 (Jun 2008) DC and Switching Characteristics v1.2	Table note references were added to Table 2-2 • Recommended Operating Conditions 1, and the order of the table notes was changed.	2-2
	The title for Table 2-4 • Overshoot and Undershoot Limits 1 was modified to remove "as measured on quiet I/Os." Table note 1 was revised to remove "estimated SSO density over cycles." Table note 2 was revised to remove "refers only to overshoot/undershoot limits for simultaneous switching I/Os."	2-3
	The "Power per I/O Pin" section was updated to include 3 additional tables pertaining to input buffer power and output buffer power.	2-7
	Table 2-29 • I/O Output Buffer Maximum Resistances 1 was revised to include values for 3.3 V PCI/PCI-X.	2-27
	Table 2-90 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-66
Revision 3 (Jun 2008) Packaging v1.3	Pin numbers were added to the "QN68 – Bottom View" package diagram. Note 2 was added below the diagram.	4-3
	The "QN132 – Bottom View" package diagram was updated to include D1 to D4. In addition, note 1 was changed from top view to bottom view, and note 2 is new.	4-6
Revision 2 (Feb 2008) Product Brief v1.0	This document was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
	This document was updated to include A3P015 device information. QN68 is a new package that was added because it is offered in the A3P015.
