Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

The length of time an I/O can withstand IOSH/IOSL events depends on the junction temperature. The reliability data below is based on a 3.3 V, 12 mA I/O setting, which is the worst case for this type of analysis.

For example, at 100°C, the short current condition would have to be sustained for more than six months to cause a reliability concern. The I/O design does not contain any short circuit protection, but such protection would only be needed in extremely prolonged stress conditions.

Temperature	Time before Failure

0°C	> 20 years
25°C	> 20 years
70°C	5 years
85°C	2 years
100°C	0.5 years

Table 2-36 • I/O Input Rise Time, Fall Time, and Related I/O Reliability

Input Buffer	Input Rise/Fall Time (min)	Input Rise/Fall Time (max)	Reliability
LVTTTL/LVCMOS	No requirement	10 ns *	20 years (110°C)
LVDS/B-LVDS/ M-LVDS/LVPECL	No requirement	10 ns *	10 years (100°C)

Note: *The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.

3 – Pin Descriptions

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. In general, unused I/O banks should have their corresponding VCCIX pins tied to GND. If an output pad is terminated to ground through any resistor and if the corresponding VCCIX is left floating, then the leakage current to ground is ~ 0uA. However, if an output pad is terminated to ground through any resistor and the corresponding VCCIX grounded, then the leakage current to ground is ~ 3 uA. For unused banks the aforementioned behavior is to be taken into account while deciding if it's better to float VCCIX of unused bank or tie it to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. x is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V.

When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the [ProASIC3 FPGA Fabric User's Guide](#) for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on ProASIC3 devices.

VCOMPLA/B/C/D/E/F **PLL Ground**

Ground to analog PLL power supplies. When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on ProASIC3 devices.

Revision	Changes	Page
Advance v0.3	The "PLL Macro" section was updated. EXTFB information was removed from this section.	2-15
	The CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT} was updated in Table 2-11 • ProASIC3 CCC/PLL Specification	2-29
	EXTFB was removed from Figure 2-27 • CCC/PLL Macro.	2-28
	Table 2-13 • ProASIC3 I/O Features was updated.	2-30
	The "Hot-Swap Support" section was updated.	2-33
	The "Cold-Sparing Support" section was updated.	2-34
	"Electrostatic Discharge (ESD) Protection" section was updated.	2-35
	The LVPECL specification in Table 2-43 • I/O Hot-Swap and 5 V Input Tolerance Capabilities in ProASIC3 Devices was updated.	2-64
	In the Bank 1 area of Figure 2-72, VMV2 was changed to VMV1 and VCCIB2 was changed to VCC _I B1.	2-97
	The VJTAG and I/O pin descriptions were updated in the "Pin Descriptions" section.	2-50
	The "JTAG Pins" section was updated.	2-51
	"128-Bit AES Decryption" section was updated to include M7 device information.	2-53
	Table 3-6 was updated.	3-6
	Table 3-7 was updated.	3-6
	In Table 3-11, PAC4 was updated.	3-93-8
	Table 3-20 was updated.	3-20
	The note in Table 3-32 was updated.	3-27
	All Timing Characteristics tables were updated from LVTTTL to Register Delays	3-31 to 3-73
	The Timing Characteristics for RAM4K9, RAM512X18, and FIFO were updated.	3-85 to 3-90
	F_{TCKMAX} was updated in Table 3-110.	3-97
Advance v0.2	Figure 2-11 was updated.	2-9
	The "Clock Resources (VersaNets)" section was updated.	2-9
	The "VersaNet Global Networks and Spine Access" section was updated.	2-9
	The "PLL Macro" section was updated.	2-15
	Figure 2-27 was updated.	2-28
	Figure 2-20 was updated.	2-19
	Table 2-5 was updated.	2-25
	Table 2-6 was updated.	2-25
	The "FIFO Flag Usage Considerations" section was updated.	2-27
	Table 2-13 was updated.	2-30
	Figure 2-24 was updated.	2-31
	The "Cold-Sparing Support" section is new.	2-34
