Microchip Technology - A3P1000-2PQG208I Datasheet

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	147456
Number of I/O	154
Number of Gates	1000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p1000-2pqg208i

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz to 350 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz to 350 MHz
- Clock delay adjustment via programmable and fixed delays from –7.56 ns to +11.12 ns
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis (for PLL only)

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration (for PLL only).
- Output duty cycle = 50% ± 1.5% or better (for PLL only)
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used (for PLL only)
- Maximum acquisition time = 300 µs (for PLL only)
- Low power consumption of 5 mW
- Exceptional tolerance to input period jitter— allowable input jitter is up to 1.5 ns (for PLL only)
- Four precise phases; maximum misalignment between adjacent phases of 40 ps × (350 MHz / f_{OUT_CCC}) (for PLL only)

Global Clocking

ProASIC3 devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high fanout nets.

Table 2-15 • **Different Components Contributing to the Static Power Consumption in ProASIC3 Devices**

Parameter	Definition	Device Specific Static Power (mW)							
		A3P1000	A3P600	A3P400	A3P250	A3P125	A3P060	A3P030	A3P015
PDC1	Array static power in Active mode	See Table 2-7 on page 2-7.							
PDC2	I/O input pin static power (standard-dependent)	See Table 2-8 on page 2-7 through Table 2-10 on page 2-8.							
PDC3	I/O output pin static power (standard-dependent)	See Table 2-11 on page 2-9 through Table 2-13 on page 2-10.							
PDC4	Static PLL contribution	2.55 mW							
PDC5	Bank quiescent power (VCCI-dependent)	See Table 2-7 on page 2-7.							

*Note: *For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi Power spreadsheet calculator or SmartPower tool in Libero SoC software.*

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in Table 2-16 on page 2-14.
- Enable rates of output buffers—guidelines are provided for typical applications in Table 2-17 on page 2-14.
- Read rate and write rate to the memory—guidelines are provided for typical applications in Table 2-17 on page 2-14. The calculation should be repeated for each clock domain defined in the design.

Methodology

Total Power Consumption—P_{TOTAL}

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

$P_{STAT} = P_{DC1} + N_{INPUTS}{}^{*} P_{DC2} + N_{OUTPUTS}{}^{*} P_{DC3}$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

Total Dynamic Power Consumption—P_{DYN}

$P_{DYN} = P_{CLOCK} + P_{S-CELL} + P_{C-CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$

Global Clock Contribution—P_{CLOCK}

$P_{CLOCK} = (P_{AC1} + N_{SPINE} {}^{*} P_{AC2} + N_{ROW} {}^{*} P_{AC3} + N_{S-CELL} {}^{*} P_{AC4}) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3 FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3 FPGA Fabric User's Guide*.

RAM Contribution—P_{MEMORY}

$P_{MEMORY} = P_{AC11} * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + P_{AC12} * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in Table 2-17 on page 2-14.

PLL Contribution—P_{PLL}

$P_{PLL} = P_{DC4} + P_{AC13} * F_{CLKOUT}$

F_{CLKOUT} is the output clock frequency.[1]

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% because all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - …
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . + 0.78125%) / 8

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-16 • **Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-17 • **Enable Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

1. The PLL dynamic contribution depends on the input clock frequency, the number of output clock signals generated by the PLL, and the frequency of each output clock. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC14} * F_{CLKOUT}$ product) to the total PLL contribution.

Table 2-20 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings
Applicable to Standard I/O Banks

I/O Standard	Drive Strength	Equiv. Software Default Drive Strength Option[2]	Slew Rate	VIL Min V	VIL Max V	VIH Min V	VIH Max V	VOL Max V	VOH Min V	IOL[1] mA	IOH[1] mA
3.3 V LVTTL / 3.3 V LVCMOS	8 mA	8 mA	High	–0.3	0.8	2	3.6	0.4	2.4	8	8
3.3 V LVCMOS Wide Range[3]	100 µA	8 mA	High	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	0.1	0.1
2.5 V LVCMOS	8 mA	8 mA	High	–0.3	0.7	1.7	2.7	0.7	1.7	8	8
1.8 V LVCMOS	4 mA	4 mA	High	–0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI – 0.45	4	4
1.5 V LVCMOS	2 mA	2 mA	High	–0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.25 * VCCI	0.75 * VCCI	2	2

Notes:

1. *Currents are measured at 85°C junction temperature.*
2. *3.3 V LVCMOS wide range is applicable to 100 µA drive strength only. The configuration will NOT operate at the equivalent software default drive strength. These values are for Normal Ranges ONLY.*
3. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD-8B specification.*

Table 2-21 • Summary of Maximum and Minimum DC Input Levels
Applicable to Commercial and Industrial Conditions

DC I/O Standards	Commercial[1] IIL[3] µA	Commercial[1] IIH[4] µA	Industrial[2] IIL[3] µA	Industrial[2] IIH[4] µA

Notes:

1. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
4. *Resistance is used to measure I/O propagation delays as defined in PCI specifications. See Figure 2-11 on page 2-64 for connectivity. This resistor is not required during normal operation.*

***Table 2-33 •* I/O Short Currents IOSH/IOSL**
Applicable to Standard Plus I/O Banks

	Drive Strength	IOSL (mA)[1]	IOSH (mA)[1]

B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-13. The input and output buffer delays are available in the LVDS section in Table 2-92.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: R_S = 60 Ω and R_T = 70 Ω, given Z_0 = 50 Ω (2") and Z_{stub} = 50 Ω (~1.5").

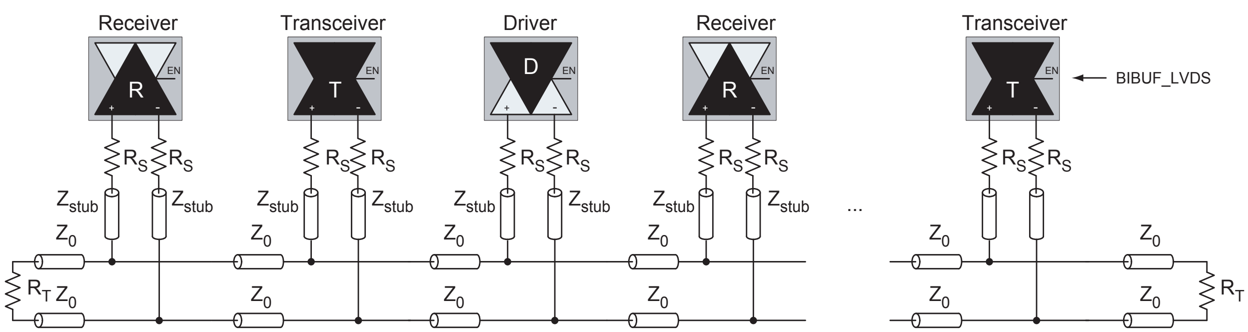

Figure 2-13 • **B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-14. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

Revision	Changes	Page
Revision 2 (cont'd)	The "ProASIC3 FPGAs Package Sizes Dimensions" table is new.	III
	In the "ProASIC3 Ordering Information", the QN package measurements were updated to include both 0.4 mm and 0.5 mm.	IV
	In the General Description section the number of I/Os was updated from 288 to 300.	1-1
Packaging v1.2	The "QN68 – Bottom View" section is new.	4-3
Revision 1 (Feb 2008) DC and Switching Characteristics v1.1	In Table 2-2 • Recommended Operating Conditions 1, T_J was listed in the symbol column and was incorrect. It was corrected and changed to T_A.	2-2
	In Table 2-3 • Flash Programming Limits – Retention, Storage and Operating Temperature, Maximum Operating Junction Temperature was changed from 110°C to 100°C for both commercial and industrial grades.	2-3
	The "PLL Behavior at Brownout Condition" section is new.	2-4
	In the "PLL Contribution—PPLL" section, the following was deleted: FCLKIN is the input clock frequency.	2-14
	In Table 2-21 • Summary of Maximum and Minimum DC Input Levels, the note was incorrect. It previously said T_J and it was corrected and changed to T_A.	2-21
	In Table 2-115 • ProASIC3 CCC/PLL Specification, the SCLK parameter and note 1 are new.	2-90
	Table 2-125 • JTAG 1532 was populated with the parameter data, which was not in the previous version of the document.	2-108
Packaging v1.1	In the "VQ100" A3P030 pin table, the function of pin 63 was incorrect and changed from IO39RSB0 to GDB0/IO38RSB0.	4-19
Revision 0 (Jan 2008)	This document was previously in datasheet v2.2. As a result of moving to the handbook format, Actel has restarted the version numbers.	N/A
v2.2 (July 2007)	The M7 and M1 device part numbers have been updated in Table 1 • ProASIC3 Product Family, "I/Os Per Package", "Automotive ProASIC3 Ordering Information", "Temperature Grade Offerings", and "Speed Grade and Temperature Grade Matrix".	i, ii, iii, iii, iv
	The words "ambient temperature" were added to the temperature range in the "Automotive ProASIC3 Ordering Information", "Temperature Grade Offerings", and "Speed Grade and Temperature Grade Matrix" sections.	iii, iv
	The T_J parameter in Table 3-2 • Recommended Operating Conditions was changed to T_A, ambient temperature, and table notes 4–6 were added.	3-2
v2.1 (May 2007)	In the "Clock Conditioning Circuit (CCC) and PLL" section, the Wide Input Frequency Range (1.5 MHz to 200 MHz) was changed to (1.5 MHz to 350 MHz).	i
	The "Clock Conditioning Circuit (CCC) and PLL" section was updated.	i
	In the "I/Os Per Package" section, the A3P030, A3P060, A3P125, ACP250, and A3P600 device I/Os were updated.	ii
	Table 3-5 • Package Thermal Resistivities was updated with A3P1000 information. The note below the table is also new.	3-5
