Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	147456
Number of I/O	154
Number of Gates	1000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p1000-pq208i

Notes:

1. *A3P015 is not recommended for new designs.*
2. *Refer to the Cortex-M1 product brief for more information.*
3. *AES is not available for Cortex-M1 ProASIC3 devices.*
4. *Six chip (main) and three quadrant global networks are available for A3P060 and above.*
5. *The M1A3P250 device does not support this package.*
6. *For higher densities and support of additional features, refer to the ProASIC3E Flash Family FPGAs datasheet.*
7. *Package not available.*

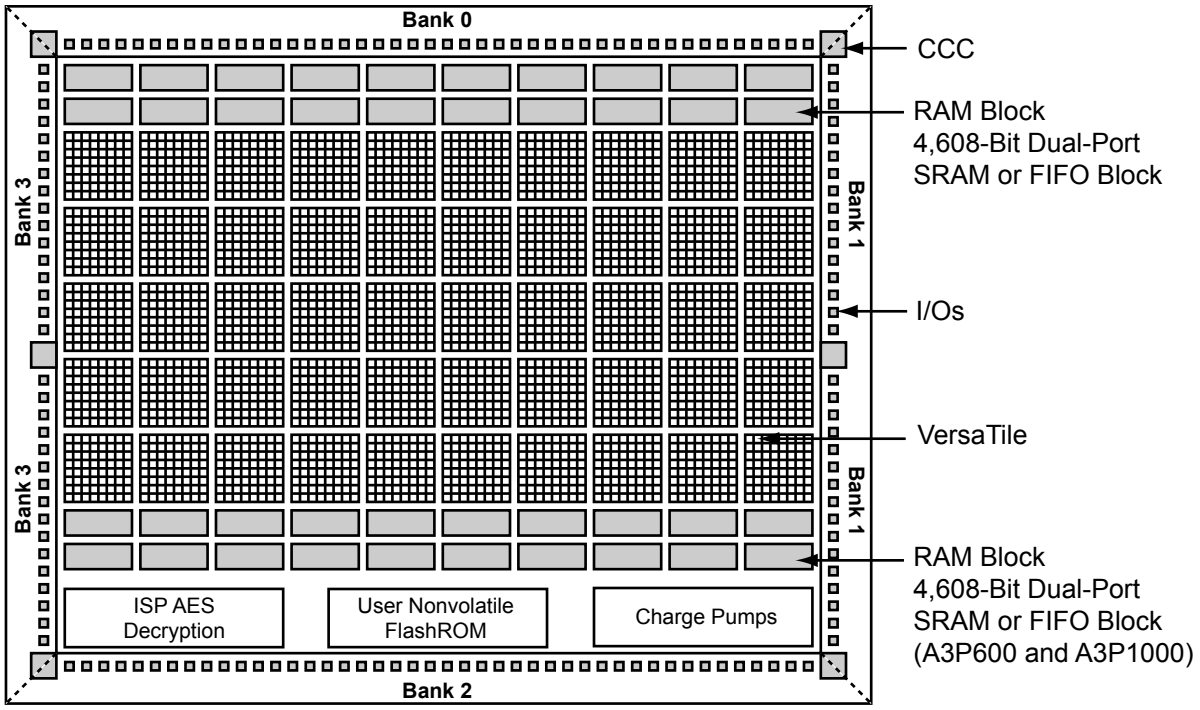

Figure 1-2 • **ProASIC3 Device Architecture Overview with Four I/O Banks (A3P250, A3P600, and A3P1000)**

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the ProASIC3 core tile as either a three-input lookup table (LUT) equivalent or as a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the Microsemi ProASIC family of third-generation architecture flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

VersaTiles

The ProASIC3 core consists of VersaTiles, which have been enhanced beyond the ProASIC[PLUS]® core tiles. The ProASIC3 VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to Figure 1-3 for VersaTile configurations.

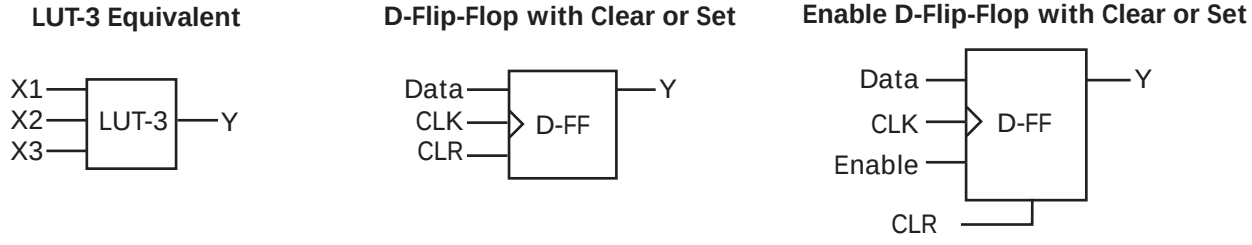

Figure 1-3 • **VersaTile Configurations**

3.3 V LVCMOS Wide Range

Table 2-47 • Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks

3.3 V LVCMOS Wide Range	Equiv. Software Default Drive Strength Option[1]	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[2]	IIH[3]
Drive Strength		Min V	Max V	Min V	Max V	Max V	Min V	µA	µA	Max mA[4]	Max mA[4]	µA[5]	µA[5]
100 µA	2 mA	–0.3	0.8	2	3.6	0.2	VDD – 0.2	100	100	25	27	10	10
100 µA	4 mA	–0.3	0.8	2	3.6	0.2	VDD – 0.2	100	100	25	27	10	10

Notes:

1. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
3. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges*
4. *Currents are measured at 85°C junction temperature.*
5. *All LVMCOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.*
6. *Software default selection highlighted in gray.*

3 – Pin Descriptions

Supply Pins

GND **Ground**

Ground supply voltage to the core, I/O outputs, and I/O logic.

GNDQ **Ground (quiet)**

Quiet ground supply voltage to input buffers of I/O banks. Within the package, the GNDQ plane is decoupled from the simultaneous switching noise originated from the output buffer ground domain. This minimizes the noise transfer within the package and improves input signal integrity. GNDQ must always be connected to GND on the board.

VCC **Core Supply Voltage**

Supply voltage to the FPGA core, nominally 1.5 V. VCC is required for powering the JTAG state machine in addition to VJTAG. Even when a device is in bypass mode in a JTAG chain of interconnected devices, both VCC and VJTAG must remain powered to allow JTAG signals to pass through the device.

VCCIBx **I/O Supply Voltage**

Supply voltage to the bank's I/O output buffers and I/O logic. Bx is the I/O bank number. There are up to eight I/O banks on low power flash devices plus a dedicated VJTAG bank. Each bank can have a separate VCCI connection. All I/Os in a bank will run off the same VCCIBx supply. VCCI can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. In general, unused I/O banks should have their corresponding VCCIX pins tied to GND. If an output pad is terminated to ground through any resistor and if the corresponding VCCIX is left floating, then the leakage current to ground is ~ 0uA. However, if an output pad is terminated to ground through any resistor and the corresponding VCCIX grounded, then the leakage current to ground is ~ 3 uA. For unused banks the aforementioned behavior is to be taken into account while deciding if it's better to float VCCIX of unused bank or tie it to GND.

VMVx **I/O Supply Voltage (quiet)**

Quiet supply voltage to the input buffers of each I/O bank. *x* is the bank number. Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks. This minimizes the noise transfer within the package and improves input signal integrity. Each bank must have at least one VMV connection, and no VMV should be left unconnected. All I/Os in a bank run off the same VMVx supply. VMV is used to provide a quiet supply voltage to the input buffers of each I/O bank. VMVx can be 1.5 V, 1.8 V, 2.5 V, or 3.3 V, nominal voltage. Unused I/O banks should have their corresponding VMV pins tied to GND. VMV and VCCI should be at the same voltage within a given I/O bank. Used VMV pins must be connected to the corresponding VCCI pins of the same bank (i.e., VMV0 to VCCIB0, VMV1 to VCCIB1, etc.).

VCCPLA/B/C/D/E/F **PLL Supply Voltage**

Supply voltage to analog PLL, nominally 1.5 V.

When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground. Microsemi recommends tying VCCPLx to VCC and using proper filtering circuits to decouple VCC noise from the PLLs. Refer to the PLL Power Supply Decoupling section of the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the *ProASIC3 FPGA Fabric User's Guide* for a complete board solution for the PLL analog power supply and ground.

There is one VCCPLF pin on ProASIC3 devices.

VCOMPLA/B/C/D/E/F PLL Ground

Ground to analog PLL power supplies. When the PLLs are not used, the Designer place-and-route tool automatically disables the unused PLLs to lower power consumption. The user should tie unused VCCPLx and VCOMPLx pins to ground.

There is one VCOMPLF pin on ProASIC3 devices.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements.

Special Function Pins

NC **No Connect**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC **Do Not Connect**

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

The following documents provide packaging information and device selection for low power flash devices.

Product Catalog

http://www.microsemi.com/soc/documents/ProdCat_PIB.pdf

Lists devices currently recommended for new designs and the packages available for each member of the family. Use this document or the datasheet tables to determine the best package for your design, and which package drawing to use.

Package Mechanical Drawings

http://www.microsemi.com/soc/documents/PckgMechDrwngs.pdf

This document contains the package mechanical drawings for all packages currently or previously supplied by Actel. Use the bookmarks to navigate to the package mechanical drawings.

Additional packaging materials are at *http://www.microsemi.com/products/solutions/package/docs.aspx*.

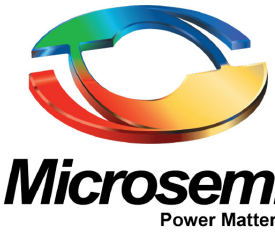
Revision	Changes	Page
Revision 5 (Aug 2008) DC and Switching Characteristics v1.3	TJ, Maximum Junction Temperature, was changed to 100° from 110º in the "Thermal Characteristics" section and EQ 1. The calculated result of Maximum Power Allowed has thus changed to 1.463 W from 1.951 W.	2-6
	Values for the A3P015 device were added to Table 2-7 • Quiescent Supply Current Characteristics.	2-7
	Values for the A3P015 device were added to Table 2-14 • Different Components Contributing to Dynamic Power Consumption in ProASIC3 Devices. P_{AC14} was removed. Table 2-15 • Different Components Contributing to the Static Power Consumption in ProASIC3 Devices is new.	2-11, 2-12
	The "PLL Contribution—PPLL" section was updated to change the P_{PLL} formula from $P_{AC13} + P_{AC14} * F_{CLKOUT}$ to $P_{DC4} + P_{AC13} * F_{CLKOUT}$.	2-14
	Both fall and rise values were included for $t_{DDRISUD}$ and t_{DDRIHD} in Table 2-102 • Input DDR Propagation Delays.	2-78
	Table 2-107 • A3P015 Global Resource is new.	2-86
	The typical value for Delay Increments in Programmable Delay Blocks was changed from 160 to 200 in Table 2-115 • ProASIC3 CCC/PLL Specification.	2-90
Revision 4 (Jun 2008) DC and Switching Characteristics v1.2	Table note references were added to Table 2-2 • Recommended Operating Conditions 1, and the order of the table notes was changed.	2-2
	The title for Table 2-4 • Overshoot and Undershoot Limits 1 was modified to remove "as measured on quiet I/Os." Table note 1 was revised to remove "estimated SSO density over cycles." Table note 2 was revised to remove "refers only to overshoot/undershoot limits for simultaneous switching I/Os."	2-3
	The "Power per I/O Pin" section was updated to include 3 additional tables pertaining to input buffer power and output buffer power.	2-7
	Table 2-29 • I/O Output Buffer Maximum Resistances 1 was revised to include values for 3.3 V PCI/PCI-X.	2-27
	Table 2-90 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-66
Revision 3 (Jun 2008) Packaging v1.3	Pin numbers were added to the "QN68 – Bottom View" package diagram. Note 2 was added below the diagram.	4-3
	The "QN132 – Bottom View" package diagram was updated to include D1 to D4. In addition, note 1 was changed from top view to bottom view, and note 2 is new.	4-6
Revision 2 (Feb 2008) Product Brief v1.0	This document was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
	This document was updated to include A3P015 device information. QN68 is a new package that was added because it is offered in the A3P015. The following sections were updated: "Features and Benefits" "ProASIC3 Ordering Information" "Temperature Grade Offerings" "ProASIC3 Flash Family FPGAs" "A3P015 and A3P030" note Introduction and Overview (NA)	N/A



Microsemi Corporation (MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense and security, aerospace, and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs, and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet Solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif. and has approximately 4,800 employees globally. Learn more at **www.microsemi.com**.
