Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

1 – ProASIC3 Device Family Overview

General Description

ProASIC3, the third-generation family of Microsemi flash FPGAs, offers performance, density, and features beyond those of the ProASIC^{PLUS}® family. Nonvolatile flash technology gives ProASIC3 devices the advantage of being a secure, low power, single-chip solution that is Instant On. ProASIC3 is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost. These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

ProASIC3 devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). The A3P015 and A3P030 devices have no PLL or RAM support. ProASIC3 devices have up to 1 million system gates, supported with up to 144 kbits of true dual-port SRAM and up to 300 user I/Os.

ProASIC3 devices support the ARM Cortex-M1 processor. The ARM-enabled devices have Microsemi ordering numbers that begin with M1A3P (Cortex-M1) and do not support AES decryption.

Flash Advantages

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based ProASIC3 devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property (IP) cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The ProASIC3 family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the ProASIC3 family a cost-effective ASIC replacement solution, especially for applications in the consumer, networking/ communications, computing, and avionics markets.

Security

The nonvolatile, flash-based ProASIC3 devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. ProASIC3 devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

ProASIC3 devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in ProASIC3 devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. The AES standard was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. ProASIC3 devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. ProASIC3 devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

ARM-enabled ProASIC3 devices do not support user-controlled AES security mechanisms. Since the ARM core must be protected at all times, AES encryption is always on for the core logic, so bitstreams are always encrypted. There is no user access to encryption for the FlashROM programming data.

Security, built into the FPGA fabric, is an inherent component of the ProASIC3 family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The ProASIC3 family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz to 350 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz to 350 MHz
- Clock delay adjustment via programmable and fixed delays from -7.56 ns to $+11.12$ ns
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis (for PLL only)

Additional CCC specifications:

- Internal phase shift = 0° , 90° , 180° , and 270° . Output phase shift depends on the output divider configuration (for PLL only).
- Output duty cycle = $50\% \pm 1.5\%$ or better (for PLL only)
- Low output jitter: worst case $< 2.5\% \times$ clock period peak-to-peak period jitter when single global network used (for PLL only)
- Maximum acquisition time = 300 μ s (for PLL only)
- Low power consumption of 5 mW
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns (for PLL only)
- Four precise phases; maximum misalignment between adjacent phases of $40\text{ ps} \times (350\text{ MHz} / f_{OUT_CCC})$ (for PLL only)

Global Clocking

ProASIC3 devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high fanout nets.

Notes:

1. The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is $\pm 100 \mu\text{A}$. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

VersaTile Specifications as a Sequential Module

The ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the [Fusion, IGLOO/e, and ProASIC3/E Macro Library Guide](#).

Notes:

1. Maximum value obtained for a -2 speed-grade device in worst-case commercial conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.
2. This delay is a function of voltage and temperature. See Table 2-6 on page 2-6 for deratings.
3. $T_J = 25^\circ\text{C}$, $VCC = 1.5 \text{ V}$
4. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help for more information.
5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.
6. The A3P030 device does not contain a PLL.

5 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the ProASIC3 datasheet.

| Revision | Changes | Page |
|--------------------------------|--|---|
| Revision 18 (March 2016) | Updated 3.3 V DC supply voltage's maximum Commercial and Industrial values from 3.3 V to 3.6 V in Table 2-2 (SAR 72693). | 2-2 |
| | Added reference of Package Mechanical Drawings document in all package pin assignment notes (76833). | NA |
| Revision 17 (June 2015) | Removed PQFP embedded heat spreader info. from Table 2-5 (SAR 52320). | 2-6 |
| | Updated " VCCIBx I/O Supply Voltage " (SAR 43323). | 3-1 |
| Revision 16 (December 2014) | Updated " ProASIC3 Ordering Information ". Interchanged the positions of Y- Security Feature and I- Application (Temperature Range) (SAR 61079). Added Note "Only devices with package size greater than or equal to 5x5 are supported". | 1-IV |
| | Updated Table Note (2) in Table 2-3 • Flash Programming Limits – Retention, Storage and Operating Temperature so that the Table Note is not applicable for Maximum Storage Temperature T_{STG} (SAR 54297). | 2-3 |
| | Added values for Drive strength 2 mA in Table 2-41 • 3.3 V LVTTL / 3.3 V LVCMOS High Slew , Table 2-42 • 3.3 V LVTTL / 3.3 V LVCMOS Low Slew , Table 2-43 • 3.3 V LVTTL / 3.3 V LVCMOS High Slew , and Table 2-44 • 3.3 V LVTTL / 3.3 V LVCMOS Low Slew (SAR 57184). | 2-34, 2-35, 2-36, 2-37 |
| | Added Figure 2-1 • High-Temperature Data Retention (HTR) (SAR 45466). | 2-3 |
| | Updates made to maintain the style and consistency of the document. | NA |
| Revision 15 (July 2014) | Added corner pad table note (3) to " QN132 – Bottom View " (SAR 47442). | 4-6 |
| | Ambient temperature removed in Table 2-2 , table notes and " ProASIC3 Ordering Information " figure were modified (SAR 48343). | 2-2 1-IV |
| | Other updates were made to maintain the style and consistency of the datasheet. | NA |
| Revision 14 (April 2014) | Note added for the discontinuance of QN132 package to the following tables and section: " ProASIC3 Devices ", " I/Os Per Package 1 ", " ProASIC3 FPGAs Package Sizes Dimensions " and " QN132 – Bottom View " section (SAR 55118). | I, III, 4-6 |
