

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	110592
Number of I/O	177
Number of Gates	600000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	256-LBGA
Supplier Device Package	256-FPBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p600-1fg256

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz to 350 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz to 350 MHz
- Clock delay adjustment via programmable and fixed delays from -7.56 ns to $+11.12$ ns
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis (for PLL only)

Additional CCC specifications:

- Internal phase shift = 0° , 90° , 180° , and 270° . Output phase shift depends on the output divider configuration (for PLL only).
- Output duty cycle = $50\% \pm 1.5\%$ or better (for PLL only)
- Low output jitter: worst case $< 2.5\% \times$ clock period peak-to-peak period jitter when single global network used (for PLL only)
- Maximum acquisition time = 300 μ s (for PLL only)
- Low power consumption of 5 mW
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns (for PLL only)
- Four precise phases; maximum misalignment between adjacent phases of $40\text{ ps} \times (350\text{ MHz} / f_{OUT_CCC})$ (for PLL only)

Global Clocking

ProASIC3 devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high fanout nets.

2 – ProASIC3 DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in [Table 2-1](#) may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in [Table 2-2](#) on page 2-2 is not implied.

Table 2-1 • Absolute Maximum Ratings

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI	DC I/O output buffer supply voltage	–0.3 to 3.75	V
VMV	DC I/O input buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T _{STG} ²	Storage temperature	–65 to +150	°C
T _J ²	Junction temperature	+125	°C

Notes:

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in [Table 2-4](#) on page 2-3.
2. VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on [page 3-1](#) for further information.
3. For flash programming and retention maximum limits, refer to [Table 2-3](#) on page 2-3, and for recommended operating limits, refer to [Table 2-2](#) on page 2-2.

I/O Power-Up and Supply Voltage Thresholds for Power-On Reset (Commercial and Industrial)

Sophisticated power-up management circuitry is designed into every ProASIC®3 device. These circuits ensure easy transition from the powered-off state to the powered-up state of the device. The many different supplies can power up in any sequence with minimized current spikes or surges.

In addition, the I/O will be in a known state through the power-up sequence. The basic principle is shown in [Figure 2-2 on page 2-5](#).

There are five regions to consider during power-up.

ProASIC3 I/Os are activated only if ALL of the following three conditions are met:

1. VCC and VCCI are above the minimum specified trip points ([Figure 2-2 on page 2-5](#)).
2. VCCI > VCC – 0.75 V (typical)
3. Chip is in the operating mode.

VCCI Trip Point:

Ramping up: $0.6 \text{ V} < \text{trip_point_up} < 1.2 \text{ V}$

Ramping down: $0.5 \text{ V} < \text{trip_point_down} < 1.1 \text{ V}$

VCC Trip Point:

Ramping up: $0.6 \text{ V} < \text{trip_point_up} < 1.1 \text{ V}$

Ramping down: $0.5 \text{ V} < \text{trip_point_down} < 1 \text{ V}$

VCC and VCCI ramp-up trip points are about 100 mV higher than ramp-down trip points. This specifically built-in hysteresis prevents undesirable power-up oscillations and current surges. Note the following:

- During programming, I/Os become tristated and weakly pulled up to VCCI.
- JTAG supply, PLL power supplies, and charge pump VPUMP supply have no influence on I/O behavior.

PLL Behavior at Brownout Condition

Microsemi recommends using monotonic power supplies or voltage regulators to ensure proper power-up behavior. Power ramp-up should be monotonic at least until VCC and VCCPLX exceed brownout activation levels. The VCC activation level is specified as 1.1 V worst-case (see [Figure 2-2 on page 2-5](#) for more details).

When PLL power supply voltage and/or VCC levels drop below the VCC brownout levels ($0.75 \text{ V} \pm 0.25 \text{ V}$), the PLL output lock signal goes low and/or the output clock is lost. Refer to the "Power-Up/Down Behavior of Low Power Flash Devices" chapter of the [ProASIC3 FPGA Fabric User's Guide](#) for information on clock and lock recovery.

Internal Power-Up Activation Sequence

1. Core
2. Input buffers

Output buffers, after 200 ns delay from input buffer activation.

Thermal Characteristics

Introduction

The temperature variable in the Microsemi Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

[EQ](#) can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in [Table 2-5 on page 2-6](#).

P = Power dissipation

Table 2-33 • I/O Short Currents IOSH/IOSL
Applicable to Standard Plus I/O Banks

	Drive Strength	IOSL (mA) ¹	IOSH (mA) ¹
3.3 V LVTTL / 3.3 V LVCMOS	2 mA	27	25

2. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.

Fully Registered I/O Buffers with Synchronous Enable and Asynchronous Clear

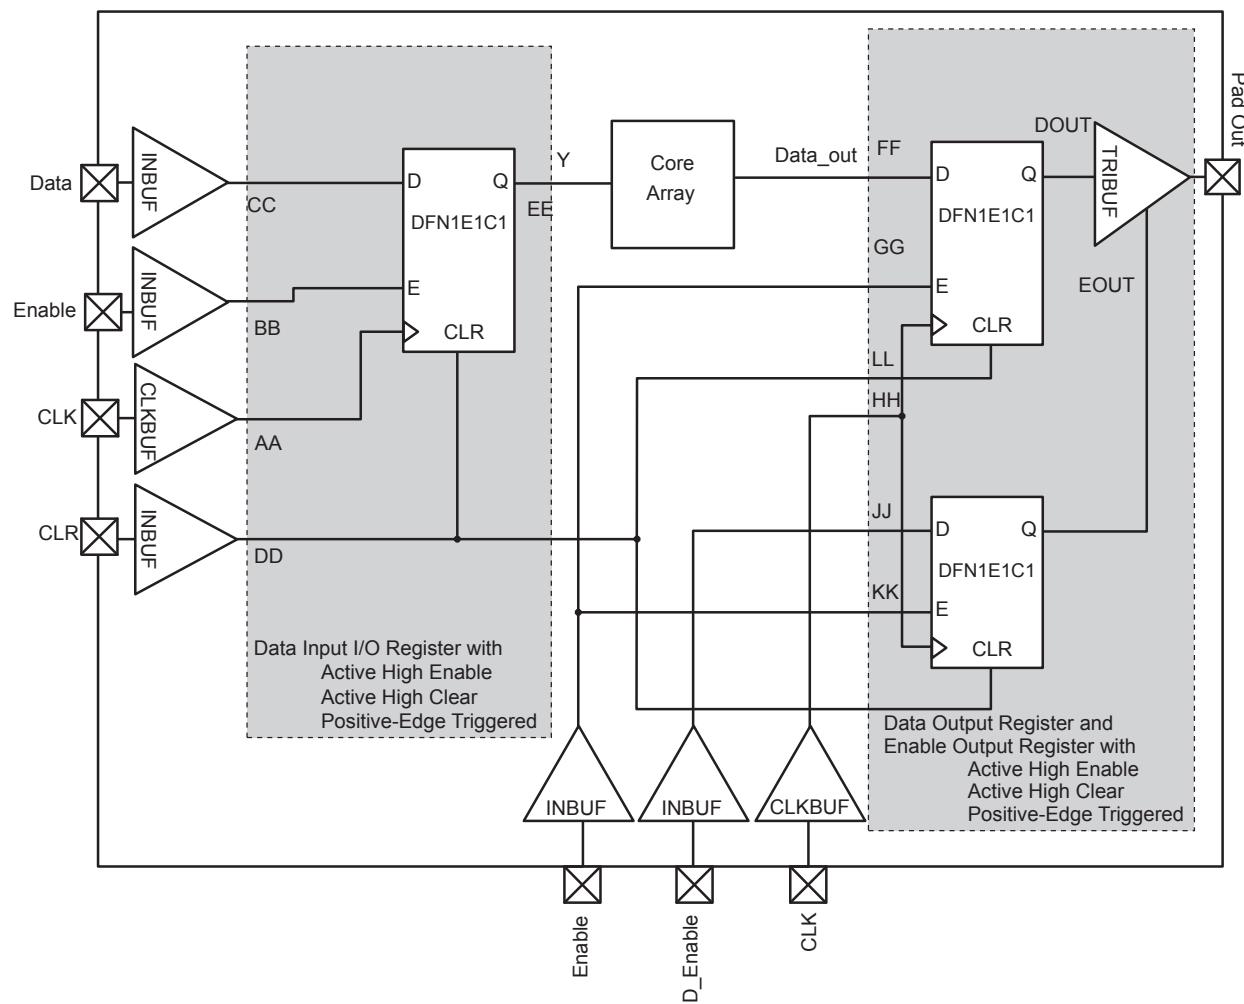

Figure 2-16 • Timing Model of the Registered I/O Buffers with Synchronous Enable and Asynchronous Clear

Table 2-113 • A3P600 Global Resource
 Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $VCC = 1.425 \text{ V}$

Parameter	Description	-2		-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.87	1.09	0.99	1.24	1.17	1.46	ns
t_{RCKH}	Input High Delay for Global Clock	0.86	1.11	0.98	1.27	1.15	1.49	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.75		0.85		1.00		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.85		0.96		1.13		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.29		0.34	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-6](#) for derating values.

Table 2-114 • A3P1000 Global Resource
 Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, $VCC = 1.425 \text{ V}$

Parameter	Description	-2		-1		Std.		Units
		Min. ¹	Max. ²	Min. ¹	Max. ²	Min. ¹	Max. ²	
t_{RCKL}	Input Low Delay for Global Clock	0.94	1.16	1.07	1.32	1.26	1.55	ns
t_{RCKH}	Input High Delay for Global Clock	0.93	1.19	1.06	1.35	1.24	1.59	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	0.75		0.85		1.00		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	0.85		0.96		1.13		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.26		0.29		0.35	ns

Notes:

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-6](#) for derating values.

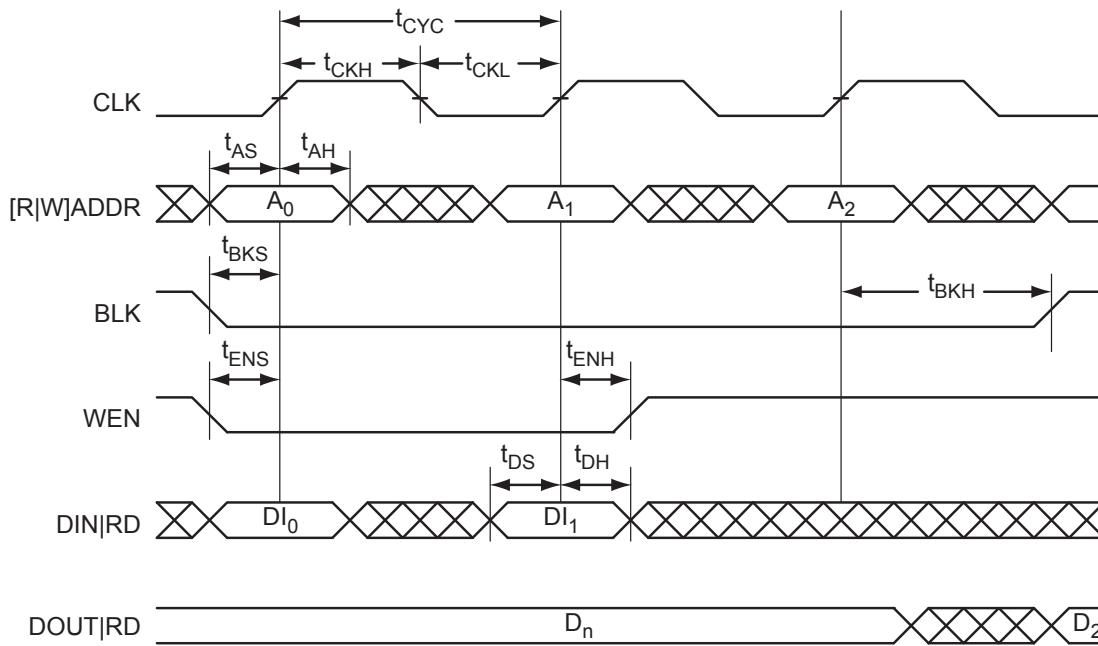

Figure 2-33 • RAM Write, Output Retained. Applicable to Both RAM4K9 and RAM512x18.

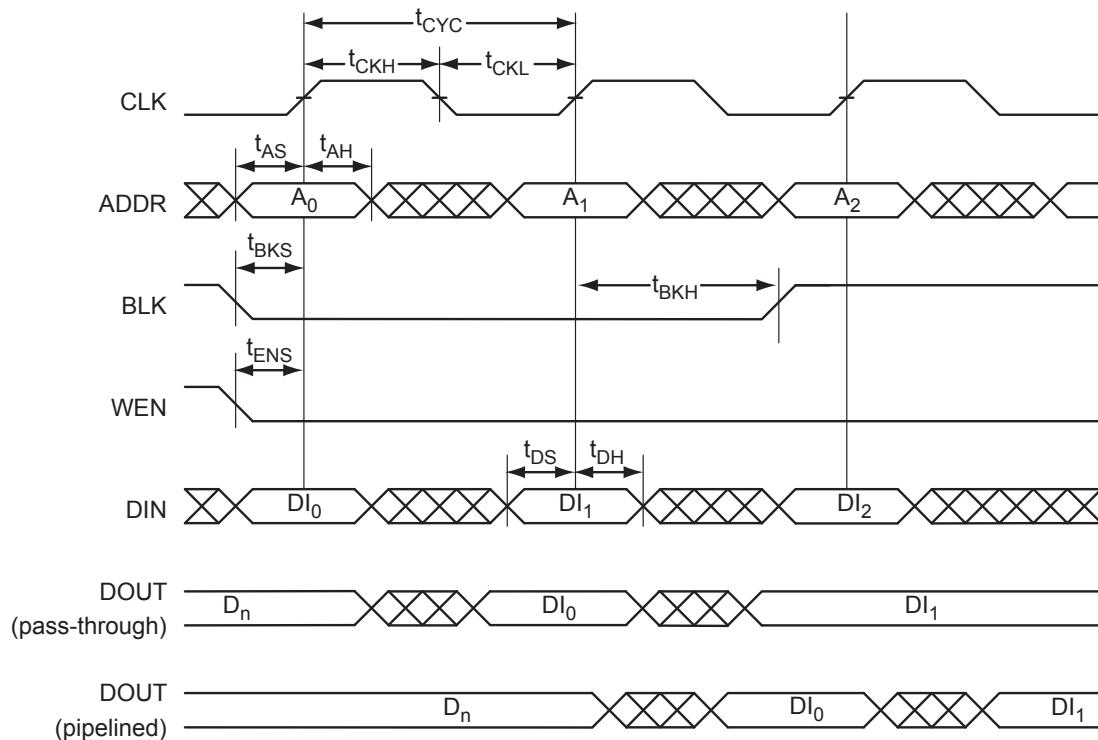

Figure 2-34 • RAM Write, Output as Write Data (WMODE = 1). Applicable to RAM4K9 Only.

Table 2-119 • FIFO (for A3P250 only, aspect-ratio-dependent)
Worst Commercial-Case Conditions: $T_J = 70^\circ\text{C}$, VCC = 1.425 V

Parameter	Description	-2	-1	Std.	Units

Revision	Changes	Page
Revision 10 (continued)	"TBD" for 3.3 V LVC MOS Wide Range in Table 2-28 • I/O Output Buffer Maximum Resistances1 through Table 2-30 • I/O Output Buffer Maximum Resistances1 was replaced by "Same as regular 3.3 V" (SAR 33852).	2-26 to 2-28
	The equations in the notes for Table 2-31 • I/O Weak Pull-Up/Pull-Down Resistances were corrected (SAR 32470).	2-28
	"TBD" for 3.3 V LVC MOS Wide Range in Table 2-32 • I/O Short Currents IOSH/IOSL through Table 2-34 • I/O Short Currents IOSH/IOSL was replaced by "Same as regular 3.3 V LVC MOS" (SAR 33852).	2-29 to 2-31
	In the "3.3 V LVC MOS Wide Range" section, values were added to Table 2-47 through Table 2-49 for IOSL and IOSH, replacing "TBD" (SAR 33852).	2-39 to 2-40
	The following sentence was deleted from the "2.5 V LVC MOS" section (SAR 24916): "It uses a 5 V-tolerant input buffer and push-pull output buffer."	2-47
	The table notes were revised for Table 2-90 • LVDS Minimum and Maximum DC Input and Output Levels (SAR 33859).	2-66
	Values were added for $F_{DDRIMAX}$ and F_{DDOMAX} in Table 2-102 • Input DDR Propagation Delays and Table 2-104 • Output DDR Propagation Delays (SAR 23919).	2-78, 2-80
	Table 2-115 • ProASIC3 CCC/PLL Specification was updated. A note was added to indicate that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 25705).	2-90
	The following figures were deleted (SAR 29991). Reference was made to a new application note, <i>Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs</i> , which covers these cases in detail (SAR 21770). Figure 2-34 • Write Access after Write onto Same Address Figure 2-35 • Read Access after Write onto Same Address Figure 2-35 • Read Access after Write onto Same Address The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-39 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SARs 29991, 30510).	2-92, 2-94, 2-99 2-102
	The "Pin Descriptions" chapter has been added (SAR 21642).	3-1
	Package names used in the "Package Pin Assignments" section were revised to match standards given in <i>Package Mechanical Drawings</i> (SAR 27395).	4-1
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "ProASIC3 Device Status" table on page IV indicates the status for each device in the device family.	N/A
