Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF_LVDS and BIBUF_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in Figure 2-13. The input and output buffer delays are available in the LVDS section in Table 2-92.

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver: R_S = 60 Ω and R_T = 70 Ω, given Z_0 = 50 Ω (2") and Z_{stub} = 50 Ω (~1.5").

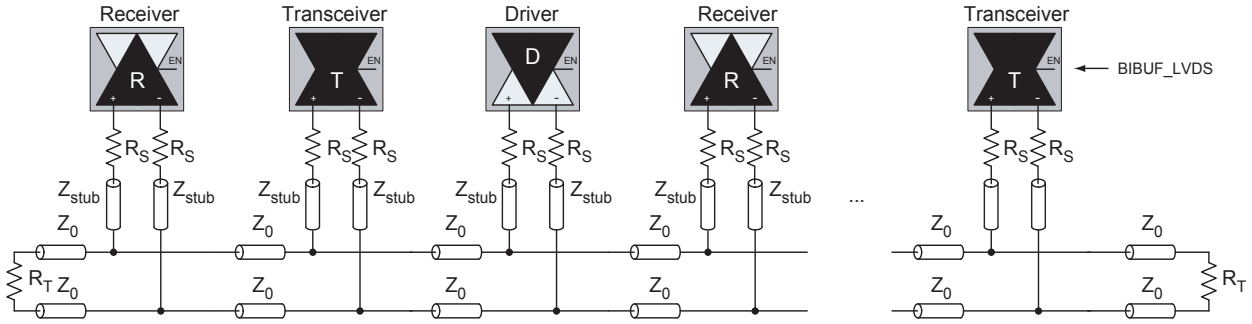

Figure 2-13 • **B-LVDS/M-LVDS Multipoint Application Using LVDS I/O Buffers**

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-14. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

mode is not used in the design, the FF pin is available as a regular I/O. For IGLOOe, ProASIC3EL, and RT ProASIC3 only, the FF pin can be configured as a Schmitt trigger input.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

TCK Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/-down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements. Refer to Table 1 for more information.

Table 1 • **Recommended Tie-Off Values for the TCK and TRST Pins**

VJTAG	Tie-Off Resistance
3.3 V	200 Ω –1 kΩ
2.5 V	200 Ω –1 kΩ
1.8 V	500 Ω –1 kΩ
1.5 V	500 Ω –1 kΩ

Notes:

1. *Equivalent parallel resistance if more than one device is on the JTAG chain*
2. *The TCK pin can be pulled up/down.*
3. *The TRST pin is pulled down.*

TDI Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from Table 1 and must satisfy the parallel resistance value requirement. The values in Table 1 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

Revision	Changes	Page
Revision 5 (Aug 2008) DC and Switching Characteristics v1.3	TJ, Maximum Junction Temperature, was changed to 100° from 110º in the "Thermal Characteristics" section and EQ 1. The calculated result of Maximum Power Allowed has thus changed to 1.463 W from 1.951 W.	2-6
	Values for the A3P015 device were added to Table 2-7 • Quiescent Supply Current Characteristics.	2-7
	Values for the A3P015 device were added to Table 2-14 • Different Components Contributing to Dynamic Power Consumption in ProASIC3 Devices. P_{AC14} was removed. Table 2-15 • Different Components Contributing to the Static Power Consumption in ProASIC3 Devices is new.	2-11, 2-12
	The "PLL Contribution—PPLL" section was updated to change the P_{PLL} formula from $P_{AC13} + P_{AC14} * F_{CLKOUT}$ to $P_{DC4} + P_{AC13} * F_{CLKOUT}$.	2-14
	Both fall and rise values were included for $t_{DDRISUD}$ and t_{DDRIHD} in Table 2-102 • Input DDR Propagation Delays.	2-78
	Table 2-107 • A3P015 Global Resource is new.	2-86
	The typical value for Delay Increments in Programmable Delay Blocks was changed from 160 to 200 in Table 2-115 • ProASIC3 CCC/PLL Specification.	2-90
Revision 4 (Jun 2008) DC and Switching Characteristics v1.2	Table note references were added to Table 2-2 • Recommended Operating Conditions 1, and the order of the table notes was changed.	2-2
	The title for Table 2-4 • Overshoot and Undershoot Limits 1 was modified to remove "as measured on quiet I/Os." Table note 1 was revised to remove "estimated SSO density over cycles." Table note 2 was revised to remove "refers only to overshoot/undershoot limits for simultaneous switching I/Os."	2-3
	The "Power per I/O Pin" section was updated to include 3 additional tables pertaining to input buffer power and output buffer power.	2-7
	Table 2-29 • I/O Output Buffer Maximum Resistances 1 was revised to include values for 3.3 V PCI/PCI-X.	2-27
	Table 2-90 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-66
Revision 3 (Jun 2008) Packaging v1.3	Pin numbers were added to the "QN68 – Bottom View" package diagram. Note 2 was added below the diagram.	4-3
