Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	110592
Number of I/O	154
Number of Gates	600000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3p600-pqg208i

ProASIC3 Device Family Overview

ProASIC3 DC and Switching Characteristics

Pin Descriptions

Package Pin Assignments

Datasheet Information

2 – ProASIC3 DC and Switching Characteristics

General Specifications

Operating Conditions

Stresses beyond those listed in Table 2-1 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in Table 2-2 on page 2-2 is not implied.

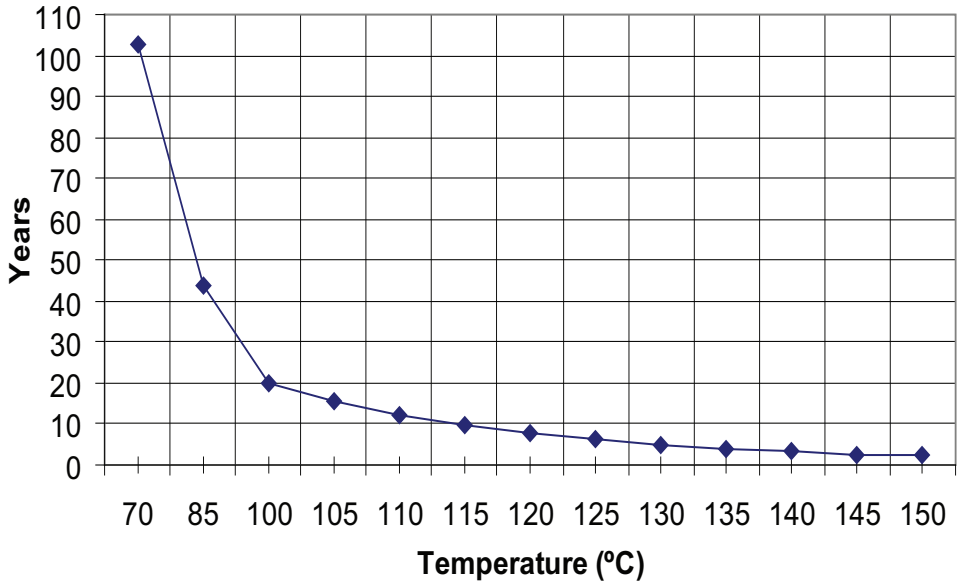
Table 2-1 • **Absolute Maximum Ratings**

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI	DC I/O output buffer supply voltage	–0.3 to 3.75	V
VMV	DC I/O input buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T_{STG} [2]	Storage temperature	–65 to +150	°C
T_J [2]	Junction temperature	+125	°C

Notes:

1. *The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 2-4 on page 2-3.*
2. *VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information.*
3. *For flash programming and retention maximum limits, refer to Table 2-3 on page 2-3, and for recommended operating limits, refer to Table 2-2 on page 2-2.*

Tj (°C)	HTR Lifetime (yrs)
70	102.7
85	43.8
100	20.0
105	15.6
110	12.3
115	9.7
120	7.7
125	6.2
130	5.0
135	4.0
140	3.3
145	2.7
150	2.2



Note: HTR time is the period during which you would not expect a verify failure due to flash cell leakage.

Figure 2-1 • **High-Temperature Data Retention (HTR)**

Table 2-3 • **Flash Programming Limits – Retention, Storage and Operating Temperature[1]**

Product Grade	Programming Cycles	Program Retention (biased/unbiased)	Maximum Storage Temperature T_{STG} (°C)	Maximum Operating Junction Temperature T_J (°C)[2]
Commercial	500	20 years	110	100
Industrial	500	20 years	110	100

1. *This is a stress rating only; functional operation at any condition other than those indicated is not implied.*
2. *These limits apply for program/data retention only. Refer to Table 2-1 on page 2-1 and Table 2-2 for device operating conditions and absolute limits.*

Table 2-4 • **Overshoot and Undershoot Limits [1]**

VCCI and VMV	Average VCCI–GND Overshoot or Undershoot Duration as a Percentage of Clock Cycle[2]	Maximum Overshoot/ Undershoot[2]
2.7 V or less	10%	1.4 V
	5%	1.49 V
3 V	10%	1.1 V
	5%	1.19 V
3.3 V	10%	0.79 V
	5%	0.88 V
3.6 V	10%	0.45 V
	5%	0.54 V

Notes:

1. *Based on reliability requirements at 85°C.*
2. *The duration is allowed at one out of six clock cycles. If the overshoot/undershoot occurs at one out of two cycles, the maximum overshoot/undershoot has to be reduced by 0.15 V.*
3. *This table does not provide PCI overshoot/undershoot limits.*

Table 2-25 • Summary of I/O Timing Characteristics—Software Default Settings –2 Speed Grade, Commercial-Case Conditions: T_J = 70°C, Worst Case VCC = 1.425 V, Worst-Case VCCI (per standard) Standard Plus I/O Banks

I/O Standard	Drive Strength	Equiv. Software Default Drive Strength Option[1]	Slew Rate	Capacitive Load (pF)	External Resistor	t_{DOUT} (ns)	t_{DP} (ns)	t_{DIN} (ns)	t_{PY} (ns)	t_{EOUT} (ns)	t_{ZL} (ns)	t_{ZH} (ns)	t_{LZ} (ns)	t_{HZ} (ns)	t_{ZLS} (ns)	t_{ZHS} (ns)	Units

3.3 V PCI-X	Per PCI-X spec	–	High	10	25[4]	0.45	1.72	0.03	0.62	0.32	1.76	1.27	2.08	2.41	3.42	2.94	ns

Notes:

1. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
4. *Resistance is used to measure I/O propagation delays as defined in PCI specifications. See Figure 2-11 on page 2-64 for connectivity. This resistor is not required during normal operation.*

Revision	Changes	Page
Revision 11 (March 2012)	Note indicating that A3P015 is not recommended for new designs has been added. The "Devices Not Recommended For New Designs" section is new (SAR 36760).	I to IV
	The following sentence was removed from the Advanced Architecture section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOO devices via an IEEE 1532 JTAG interface" (SAR 34687).	NA
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—PCLOCK" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3 FPGA Fabric User's Guide* (SAR 34734).	2-12
	Figure 2-4 • Input Buffer Timing Model and Delays (Example) has been modified for the DIN waveform; the Rise and Fall time label has been changed to tDIN (35430).	2-16
	The AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match tables in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section (SAR 34883).	2-32
	Added values for minimum pulse width and removed the FRMAX row from Table 2-107 through Table 2-114 in the "Global Tree Timing Characteristics" section. Use the software to determine the FRMAX for the device you are using (SARs 37279, 29269).	2-85

Revision	Changes	Page
Revision 10 (September 2011)	The "In-System Programming (ISP) and Security" section and Security section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865).	I
	The value of 34 I/Os for the QN48 package in A3P030 was added to the "I/Os Per Package 1" section (SAR 33907).	III
	The Y security option and Licensed DPA Logo were added to the "ProASIC3 Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 32151).	IV
	The "Specifying I/O States During Programming" section is new (SAR 21281).	1-7
	In Table 2-2 • Recommended Operating Conditions 1, VPUMP programming voltage in programming mode was changed from "3.0 to 3.6" to "3.15 to 3.45" (SAR 30666). It was corrected in v2.0 of this datasheet in April 2007 but inadvertently changed back to “3.0 to 3.6 V” in v1.4 in August 2009. The following changes were made to Table 2-2 • Recommended Operating Conditions 1: VCCPLL analog power supply (PLL) was changed from "1.4 to 1.6" to "1.425 to 1.575" (SAR 33850). For VCCI and VMV, values for 3.3 V DC and 3.3 V DC Wide Range were corrected. The correct value for 3.3 V DC is "3.0 to 3.6 V" and the correct value for 3.3 V Wide Range is "2.7 to 3.6" (SAR 33848).	2-2
	Table 2-25 • Summary of I/O Timing Characteristics—Software Default Settings was update to restore values to the correct columns. Previously the Slew Rate column was missing and data were aligned incorrectly (SAR 34034).	2-24
	The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section and "3.3 V LVCMOS Wide Range" section tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is ±100 µA. The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 25700).	2-22, 2-39

Revision	Changes	Page
Revision 10 (continued)	"TBD" for 3.3 V LVCMOS Wide Range in Table 2-28 • I/O Output Buffer Maximum Resistances1 through Table 2-30 • I/O Output Buffer Maximum Resistances1 was replaced by "Same as regular 3.3 V" (SAR 33852).	2-26 to 2-28
	The equations in the notes for Table 2-31 • I/O Weak Pull-Up/Pull-Down Resistances were corrected (SAR 32470).	2-28
	"TBD" for 3.3 V LVCMOS Wide Range in Table 2-32 • I/O Short Currents IOSH/IOSL through Table 2-34 • I/O Short Currents IOSH/IOSL was replaced by "Same as regular 3.3 V LVCMOS" (SAR 33852).	2-29 to 2-31
	In the "3.3 V LVCMOS Wide Range" section, values were added to Table 2-47 through Table 2-49 for IOSL and IOSH, replacing "TBD" (SAR 33852).	2-39 to 2-40
	The following sentence was deleted from the "2.5 V LVCMOS" section (SAR 24916): "It uses a 5 V–tolerant input buffer and push-pull output buffer."	2-47
	The table notes were revised for Table 2-90 • LVDS Minimum and Maximum DC Input and Output Levels (SAR 33859).	2-66
	Values were added for $F_{DDRIMAX}$ and F_{DDOMAX} in Table 2-102 • Input DDR Propagation Delays and Table 2-104 • Output DDR Propagation Delays (SAR 23919).	2-78, 2-80
	Table 2-115 • ProASIC3 CCC/PLL Specification was updated. A note was added to indicate that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 25705).	2-90
	The following figures were deleted (SAR 29991). Reference was made to a new application note, *Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs*, which covers these cases in detail (SAR 21770). Figure 2-34 • Write Access after Write onto Same Address Figure 2-35 • Read Access after Write onto Same Address Figure 2-35 • Read Access after Write onto Same Address The port names in the SRAM "Timing Waveforms", SRAM "Timing Characteristics" tables, Figure 2-39 • FIFO Reset, and the FIFO "Timing Characteristics" tables were revised to ensure consistency with the software names (SARs 29991, 30510).	2-92, 2-94, 2-99 2-102
	The "Pin Descriptions" chapter has been added (SAR 21642).	3-1
	Package names used in the "Package Pin Assignments" section were revised to match standards given in *Package Mechanical Drawings* (SAR 27395).	4-1
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The "ProASIC3 Device Status" table on page IV indicates the status for each device in the device family.	N/A
