Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	36864
Number of I/O	97
Number of Gates	250000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LBGA
Supplier Device Package	144-FPBGA (13x13)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/m1a3p250-fg144i

1 – ProASIC3 Device Family Overview

General Description

ProASIC3, the third-generation family of Microsemi flash FPGAs, offers performance, density, and features beyond those of the ProASIC[PLUS]® family. Nonvolatile flash technology gives ProASIC3 devices the advantage of being a secure, low power, single-chip solution that is Instant On. ProASIC3 is reprogrammable and offers time-to-market benefits at an ASIC-level unit cost. These features enable designers to create high-density systems using existing ASIC or FPGA design flows and tools.

ProASIC3 devices offer 1 kbit of on-chip, reprogrammable, nonvolatile FlashROM storage as well as clock conditioning circuitry based on an integrated phase-locked loop (PLL). The A3P015 and A3P030 devices have no PLL or RAM support. ProASIC3 devices have up to 1 million system gates, supported with up to 144 kbits of true dual-port SRAM and up to 300 user I/Os.

ProASIC3 devices support the ARM Cortex-M1 processor. The ARM-enabled devices have Microsemi ordering numbers that begin with M1A3P (Cortex-M1) and do not support AES decryption.

Flash Advantages

Reduced Cost of Ownership

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, flash-based ProASIC3 devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and field upgrades with confidence that valuable intellectual property (IP) cannot be compromised or copied. Secure ISP can be performed using the industry-standard AES algorithm. The ProASIC3 family device architecture mitigates the need for ASIC migration at higher user volumes. This makes the ProASIC3 family a cost-effective ASIC replacement solution, especially for applications in the consumer, networking/ communications, computing, and avionics markets.

Security

The nonvolatile, flash-based ProASIC3 devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. ProASIC3 devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

ProASIC3 devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in ProASIC3 devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. The AES standard was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. ProASIC3 devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. ProASIC3 devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

ARM-enabled ProASIC3 devices do not support user-controlled AES security mechanisms. Since the ARM core must be protected at all times, AES encryption is always on for the core logic, so bitstreams are always encrypted. There is no user access to encryption for the FlashROM programming data.

Security, built into the FPGA fabric, is an inherent component of the ProASIC3 family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The ProASIC3 family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks.

The absolute maximum junction temperature is 100°C. EQ 1 shows a sample calculation of the absolute maximum power dissipation allowed for a 484-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (°C)} - \text{Max. ambient temp. (°C)}}{\theta_{ja}(\text{°C/W})} = \frac{100\text{°C} - 70\text{°C}}{20.5\text{°C/W}} = 1.463\ \text{W}$$

EQ 1

Table 2-5 • **Package Thermal Resistivities**

Package Type	Device	Pin Count	θ_{jc}	θ_{ja}			Units
				Still Air	200 ft/min	500 ft/min	
Quad Flat No Lead	A3P030	132	0.4	21.4	16.8	15.3	°C/W
	A3P060	132	0.3	21.2	16.6	15.0	°C/W

Overview of I/O Performance

Summary of I/O DC Input and Output Levels – Default I/O Software Settings

Table 2-18 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions—Software Default Settings Applicable to Advanced I/O Banks

I/O Standard	Drive Strength	Equiv. Software Default Drive Strength Option[2]	Slew Rate	VIL		VIH		VOL	VOH	IOL[1] mA	IOH[1] mA
				Min V	Max V	Min V	Max V	Max V	Min V		
3.3 V LVTTL / 3.3 V LVCMOS	12 mA	12 mA	High	–0.3	0.8	2	3.6	0.4	2.4	12	12
3.3 V LVCMOS Wide Range[3]	100 µA	12 mA	High	–0.3	0.8	2	3.6	0.2	VCCI – 0.2	0.1	0.1
2.5 V LVCMOS	12 mA	12 mA	High	–0.3	0.7	1.7	2.7	0.7	1.7	12	12
1.8 V LVCMOS	12 mA	12 mA	High	–0.3	0.35 * VCCI	0.65 * VCCI	1.9	0.45	VCCI – 0.45	12	12
1.5 V LVCMOS	12 mA	12 mA	High	–0.3	0.35 * VCCI	0.65 * VCCI	1.6	0.25 * VCCI	0.75 * VCCI	12	12
3.3 V PCI	Per PCI specifications										
3.3 V PCI-X	Per PCI-X specifications										

Notes:

1. *Currents are measured at 85°C junction temperature.*
2. *3.3 V LVCMOS wide range is applicable to 100 µA drive strength only. The configuration will NOT operate at the equivalent software default drive strength. These values are for Normal Ranges ONLY.*
3. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD-8B specification.*

Table 2-68 • Minimum and Maximum DC Input and Output Levels Applicable to Standard I/O Banks

1.8 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[3]	Max. mA[3]	µA[4]	µA[4]
2 mA	–0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI – 0.45	2	2	9	11	10	10
4 mA	–0.3	0.35 * VCCI	0.65 * VCCI	3.6	0.45	VCCI – 0.45	4	4	17	22	10	10

Notes:

1. *IIL is the input leakage current per I/O pin over recommended operation conditions where –0.3 V < VIN < VIL.*
2. *IIH is the input leakage current per I/O pin over recommended operating conditions VIH < VIN < VCCI. Input current is larger when operating outside recommended ranges.*
3. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
4. *Currents are measured at 85°C junction temperature.*
5. *Software default selection highlighted in gray.*

mode is not used in the design, the FF pin is available as a regular I/O. For IGLOOe, ProASIC3EL, and RT ProASIC3 only, the FF pin can be configured as a Schmitt trigger input.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

The Flash*Freeze pin can be used with any single-ended I/O standard supported by the I/O bank in which the pin is located, and input signal levels compatible with the I/O standard selected. The FF pin should be treated as a sensitive asynchronous signal. When defining pin placement and board layout, simultaneously switching outputs (SSOs) and their effects on sensitive asynchronous pins must be considered.

Unused FF or I/O pins are tristated with weak pull-up. This default configuration applies to both Flash*Freeze mode and normal operation mode. No user intervention is required.

JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

TCK Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/-down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements. Refer to Table 1 for more information.

Table 1 • **Recommended Tie-Off Values for the TCK and TRST Pins**

VJTAG	Tie-Off Resistance
3.3 V	200 Ω –1 kΩ
2.5 V	200 Ω –1 kΩ
1.8 V	500 Ω –1 kΩ
1.5 V	500 Ω –1 kΩ

Notes:

1. *Equivalent parallel resistance if more than one device is on the JTAG chain*
2. *The TCK pin can be pulled up/down.*
3. *The TRST pin is pulled down.*

TDI Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from Table 1 and must satisfy the parallel resistance value requirement. The values in Table 1 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

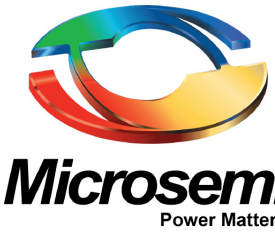
Revision	Changes	Page
Advance v0.6 (continued)	The "Programming" section was updated to include information concerning serialization.	2-53
	The "JTAG 1532" section was updated to include SAMPLE/PRELOAD information.	2-54
	"DC and Switching Characteristics" chapter was updated with new information.	3-1
	The A3P060 "100-Pin VQFP" pin table was updated.	4-13
	The A3P125 "100-Pin VQFP" pin table was updated.	4-13
	The A3P060 "144-Pin TQFP" pin table was updated.	4-16
	The A3P125 "144-Pin TQFP" pin table was updated.	4-18
	The A3P125 "208-Pin PQFP" pin table was updated.	4-21
	The A3P400 "208-Pin PQFP" pin table was updated.	4-25
	The A3P060 "144-Pin FBGA" pin table was updated.	4-32
	The A3P125 "144-Pin FBGA" pin table is new.	4-34
	The A3P400 "144-Pin FBGA" is new.	4-38
	The A3P400 "256-Pin FBGA" was updated.	4-48
	The A3P1000 "256-Pin FBGA" was updated.	4-54
	The A3P400 "484-Pin FBGA" was updated.	4-58
	The A3P1000 "484-Pin FBGA" was updated.	4-68
	The A3P250 "100-Pin VQFP*" pin table was updated.	4-14
	The A3P250 "208-Pin PQFP*" pin table was updated.	4-23
	The A3P1000 "208-Pin PQFP*" pin table was updated.	4-29
	The A3P250 "144-Pin FBGA*" pin table was updated.	4-36
	The A3P1000 "144-Pin FBGA*" pin table was updated.	4-32
	The A3P250 "256-Pin FBGA*" pin table was updated.	4-45
	The A3P1000 "256-Pin FBGA*" pin table was updated.	4-54
	The A3P1000 "484-Pin FBGA*" pin table was updated.	4-68
Advance v0.5 (November 2005)	The "I/Os Per Package" table was updated for the following devices and packages: Device — Package A3P250/M7ACP250 — VQ100 A3P250/M7ACP250 — FG144 A3P1000 — FG256	ii
Advance v0.4	M7 device information is new.	N/A
	The I/O counts in the "I/Os Per Package" table were updated.	ii
Advance v0.3	The "I/Os Per Package" table was updated.	ii
	M7 device information is new.	N/A
	Table 2-4 • ProASIC3 Globals/Spines/Rows by Device was updated to include the number or rows in each top or bottom spine.	2-16
	EXTFB was removed from Figure 2-24 • ProASIC3E CCC Options.	2-24



Microsemi Corporation (MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense and security, aerospace, and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs, and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet Solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif. and has approximately 4,800 employees globally. Learn more at **www.microsemi.com**.
