Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

1. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD-8B specification.*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
4. *Resistance is used to measure I/O propagation delays as defined in PCI specifications. See Figure 2-11 on page 2-64 for connectivity. This resistor is not required during normal operation.*

VersaTile Specifications as a Sequential Module

The ProASIC3 library offers a wide variety of sequential cells, including flip-flops and latches. Each has a data input and optional enable, clear, or preset. In this section, timing characteristics are presented for a representative sample from the library. For more details, refer to the *Fusion, IGLOO/e, and ProASIC3/E Macro Library Guide*.

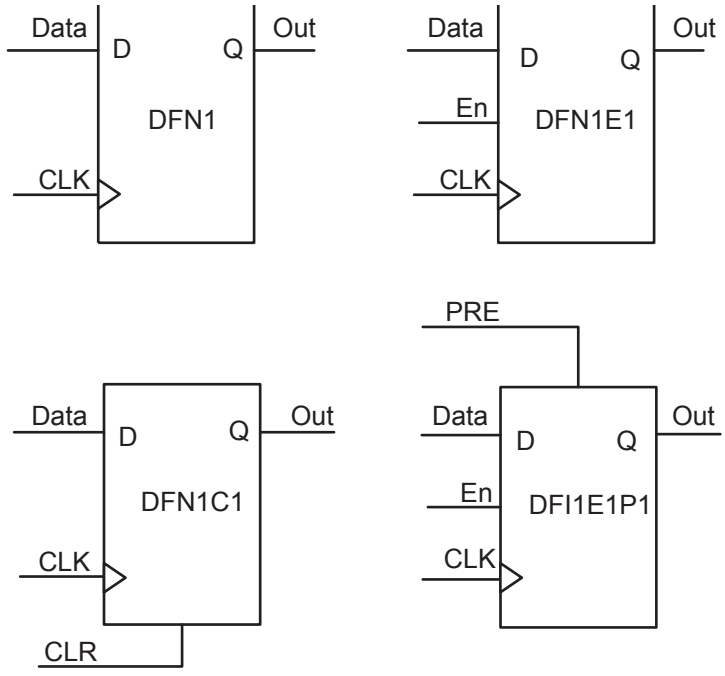

Figure 2-26 • Sample of Sequential Cells

Global Resource Characteristics

A3P250 Clock Tree Topology

Clock delays are device-specific. Figure 2-28 is an example of a global tree used for clock routing. The global tree presented in Figure 2-28 is driven by a CCC located on the west side of the A3P250 device. It is used to drive all D-flip-flops in the device.

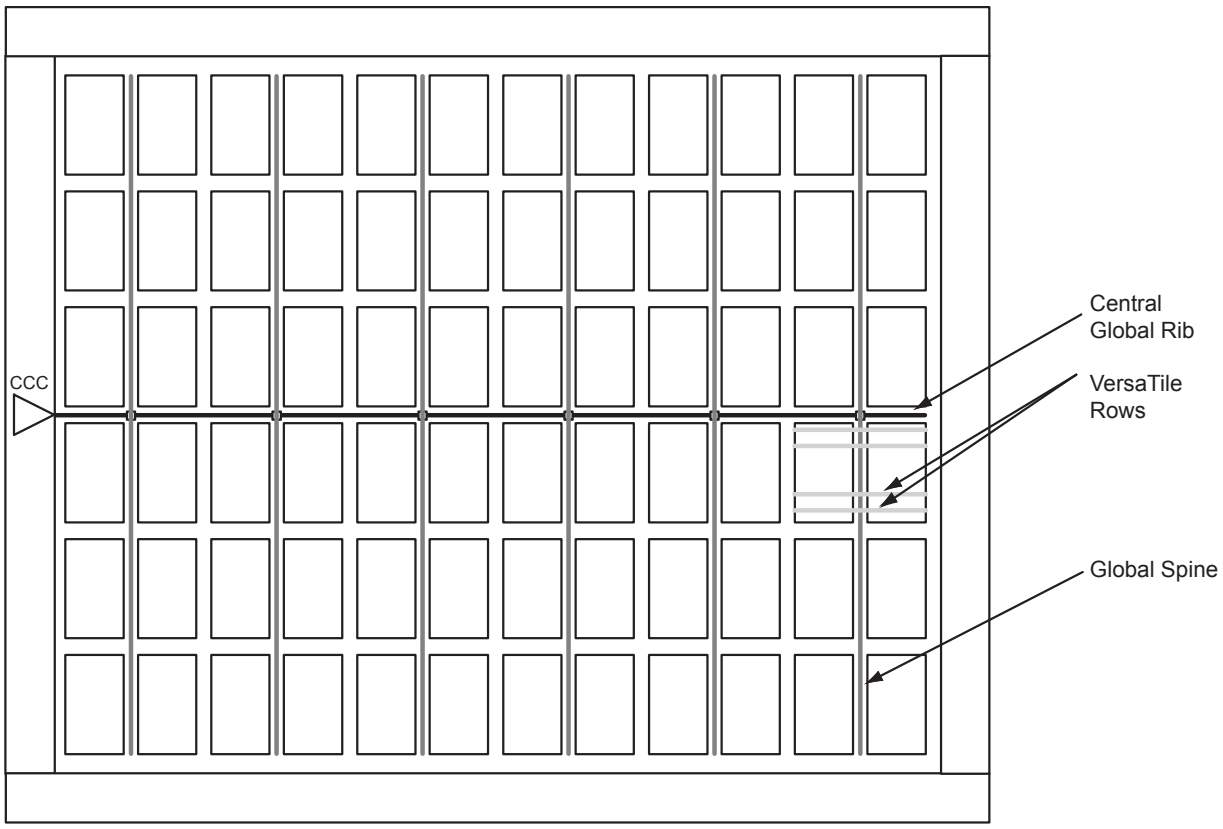

Figure 2-28 • **Example of Global Tree Use in an A3P250 Device for Clock Routing**

Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard–dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-90. Table 2-108 to Table 2-114 on page 2-89 present minimum and maximum global clock delays within each device. Minimum and maximum delays are measured with minimum and maximum loading.

Revision	Changes	Page
Revision 10 (September 2011)	The "In-System Programming (ISP) and Security" section and Security section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 32865).	I
	The value of 34 I/Os for the QN48 package in A3P030 was added to the "I/Os Per Package 1" section (SAR 33907).	III
	The Y security option and Licensed DPA Logo were added to the "ProASIC3 Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 32151).	IV
	The "Specifying I/O States During Programming" section is new (SAR 21281).	1-7
	In Table 2-2 • Recommended Operating Conditions 1, VPUMP programming voltage in programming mode was changed from "3.0 to 3.6" to "3.15 to 3.45" (SAR 30666). It was corrected in v2.0 of this datasheet in April 2007 but inadvertently changed back to “3.0 to 3.6 V” in v1.4 in August 2009. The following changes were made to Table 2-2 • Recommended Operating Conditions 1: VCCPLL analog power supply (PLL) was changed from "1.4 to 1.6" to "1.425 to 1.575" (SAR 33850). For VCCI and VMV, values for 3.3 V DC and 3.3 V DC Wide Range were corrected. The correct value for 3.3 V DC is "3.0 to 3.6 V" and the correct value for 3.3 V Wide Range is "2.7 to 3.6" (SAR 33848).	2-2
	Table 2-25 • Summary of I/O Timing Characteristics—Software Default Settings was update to restore values to the correct columns. Previously the Slew Rate column was missing and data were aligned incorrectly (SAR 34034).	2-24
	The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section and "3.3 V LVCMOS Wide Range" section tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is ±100 µA. The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 25700).	2-22, 2-39
