### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

**(6) Pull-up/down resistors**

The MB90540G/545G Series does not support internal pull-up/down resistors (except Port0 – Port3 : pull-up resistors) . Use external components where needed.

**(7) Crystal Oscillator Circuit**

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via the shortest distances from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuits do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board artwork surrounding X0 and X1 pins with a ground area for stabilizing the operation.

**(8) Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs**

Make sure to turn on the A/D converter power supply ( $AV_{CC}$ ,  $AV_{RH}$ ,  $AV_{RL}$ ) and analog inputs (AN0 to AN7) after turning-on the digital power supply ( $V_{CC}$ ) .

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage does not exceed  $AV_{RH}$  or  $AV_{CC}$  (turning on/off the analog and digital power supplies simultaneously is acceptable) .

**(9) Connection of Unused Pins of A/D Converter**

Connect unused pins of A/D converter to  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AV_{RH} = V_{SS}$ .

**(10) N.C. Pin**

The N.C. (internally connected) pin must be opened for use.

**(11) Notes on Energization**

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50  $\mu$ s or more (0.2 V to 2.7 V) .
