What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

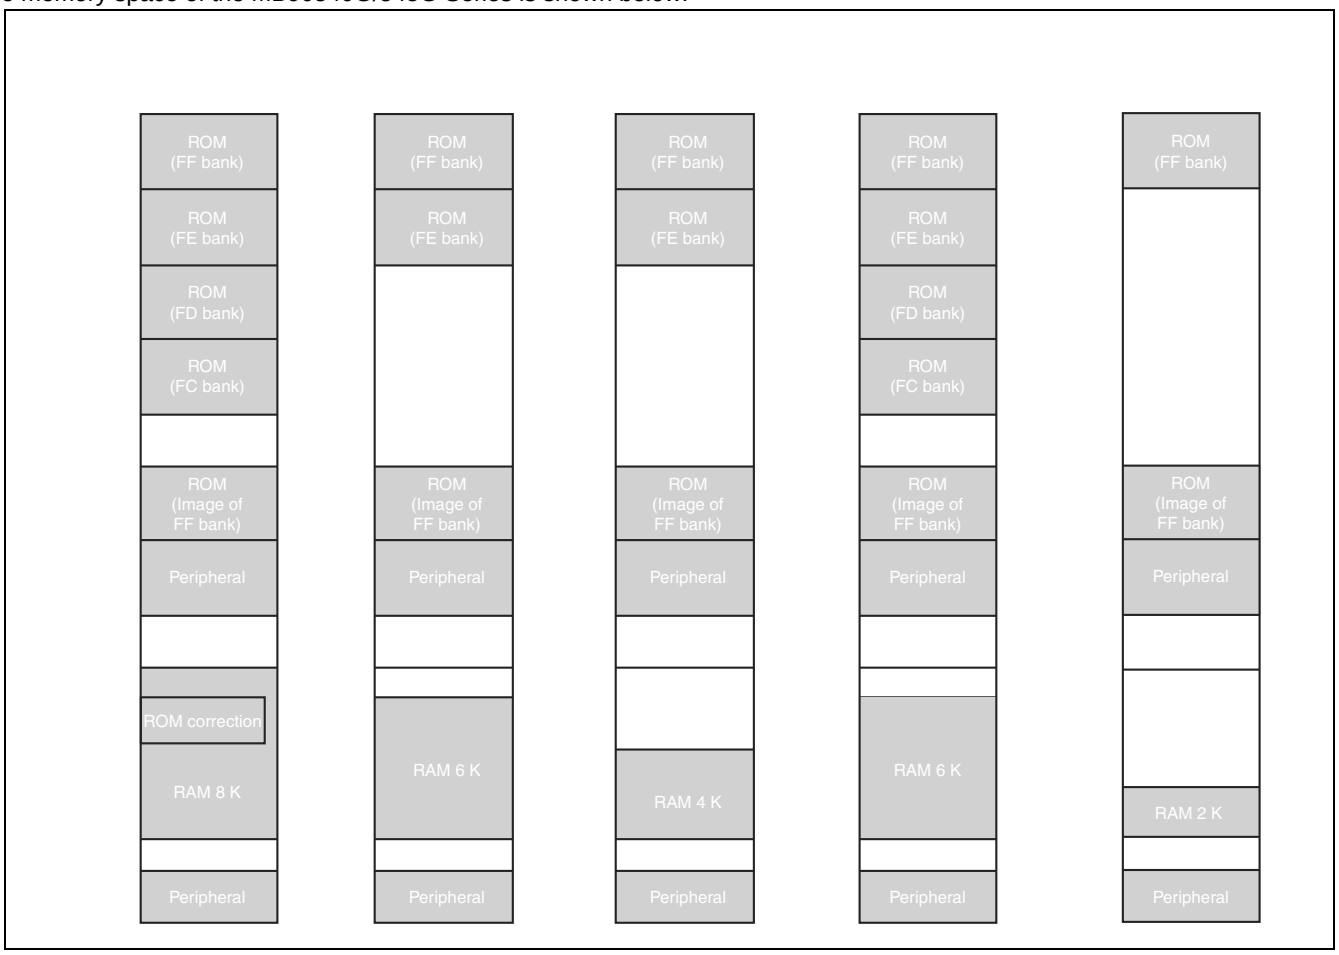
7. Memory Map

The memory space of the MB90540G/545G Series is shown below.



Note : The high-order portion of bank 00 gives the image of the FF bank ROM to make the small model of the C compiler effective. Since the low-order 16 bits address are the same, the table in ROM can be referenced without using the “far” specification in the pointer declaration.
For example, an attempt to access $00C000_H$ accesses the value at $FFC000_H$ in ROM.The ROM area in bank FF exceeds 48 Kbytes, and its entire image cannot be shown in bank 00.The image between $FF4000_H$ and $FFFFFF_H$ is visible in bank 00, while the image between $FF0000_H$ and $FF3FFF_H$ is visible only in bank FF.

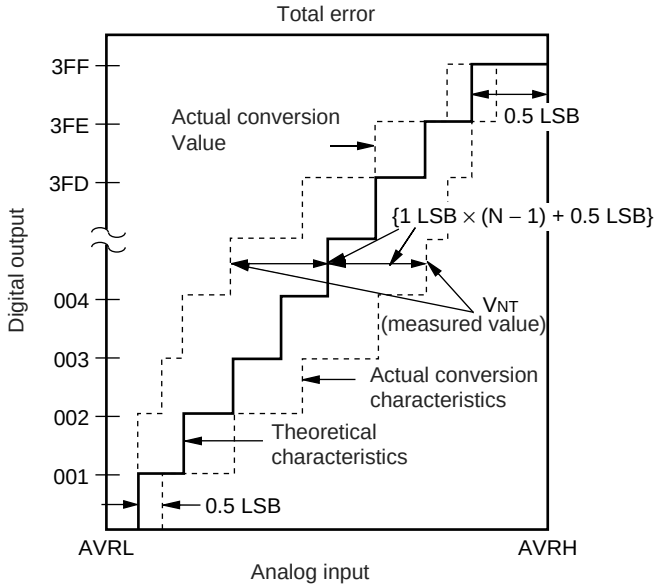
11.5.2 A/D Converter Glossary

Resolution : Analog changes that are identifiable with the A/D converter

Linearity error : The deviation of the straight line connecting the zero transition point (“00 0000 0000” ⟷ “00 0000 0001”) with the full-scale transition point (“11 1111 1110” ⟷ “11 1111 1111”) from actual conversion characteristics

Differential linearity error : The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error : The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error and linearity error.



$$1\,\text{LSB} = (\text{Theoretical value})\,\frac{\text{AVRH} - \text{AVRL}}{1024}\ [\text{V}]$$

$$V_{OT}\ (\text{Theoretical value}) = \text{AVRL} + 0.5\ \text{LSB}\ [\text{V}]$$

$$V_{FST}\ (\text{Theoretical value}) = \text{AVRH} - 1.5\ \text{LSB}\ [\text{V}]$$

$$\text{Total error for digital output N} = \frac{V_{NT} - \{1\ \text{LSB} \times (\text{N} - 1) + 0.5\ \text{LSB}\}}{1\ \text{LSB}}\ [\text{LSB}]$$

V_{NT} : Voltage at a transition of digital output from (N − 1) to N
