[**Embedded - System On Chip \(SoC\): The Heart of Modern Embedded Systems**](#)

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are [Embedded - System On Chip \(SoC\)](#)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Figure 1 • High Temperature Data Retention (HTR)

2.3.1.1 Overshoot/Undershoot Limits

For AC signals, the input signal may undershoot during transitions to -1.0 V for no longer than 10% of the period. The current during the transition must not exceed 100 mA.

For AC signals, the input signal may overshoot during transitions to $V_{CC1} + 1.0\text{ V}$ for no longer than 10% of the period. The current during the transition must not exceed 100 mA.

Note: The above specifications do not apply to the PCI standard. The IGLOO2 and SmartFusion2 PCI I/Os are compliant with the PCI standard including the PCI overshoot/undershoot specifications.

2.3.1.2 Thermal Characteristics

The temperature variable in the Microsemi SoC Products Group Designer software refers to the junction temperature, not the ambient, case, or board temperatures. This is an important distinction because dynamic and static power consumption causes the chip's junction temperature to be higher than the ambient, case, or board temperatures.

EQ1 through EQ3 give the relationship between thermal resistance, temperature gradient, and power.

$$\theta_{JA} = \frac{T_J - T_A}{P} \quad EQ\ 1$$

$$\theta_{JB} = \frac{T_J - T_B}{P} \quad EQ\ 2$$

$$\theta_{JC} = \frac{T_J - T_C}{P} \quad EQ\ 3$$

2.3.2 Power Consumption

The following sections describe the power consumptions of the devices.

2.3.2.1 Quiescent Supply Current

1. SERDES_[01]_VDD Power Supply is shorted to V_{DD}.
2. SerDes and DDR blocks to be unused.
3. V_{DDI} has been set to ON for test conditions as described. Banks on the east side should always be powered with the appropriate V_{DDI} bank supplies. For details on bank power supplies, see “Recommendation for Unused Bank Supplies” table in the AC393: *SmartFusion2 and IGLOO2 Board Design Guidelines Application Note*.
4. No Differential (that is to say, LVDS) I/Os or ODT attributes to be used.

2.3.14 Math Block Timing Characteristics

The fundamental building block in any digital signal processing algorithm is the multiply-accumulate function. Each IGLOO2 and SmartFusion2 SoC math block supports 18×18 signed multiplication, dot product, and built-in addition, subtraction, and accumulation units to combine multiplication results efficiently. The following table lists the math blocks with all registers used in worst commercial-case conditions when $T_J = 85^\circ\text{C}$, $V_{DD} = 1.14\text{ V}$.

Table 268 • Math Blocks with all Registers Used
