
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	CANbus, I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	25
Program Memory Size	32KB (16K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 5.5V
Data Converters	A/D 24x12b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f25k83-e-ml

3.0 PIC18 CPU

This family of devices contains a PIC18 8-bit CPU core based on the modified Harvard architecture. The PIC18 CPU supports:

- System Arbitration which decides memory access allocation depending on user priorities
- Vectored Interrupt capability with automatic two level deep context saving
- 31-level deep hardware stack with overflow and underflow reset capabilities
- Support Direct, Indirect, and Relative Addressing modes
- 8x8 Hardware Multiplier

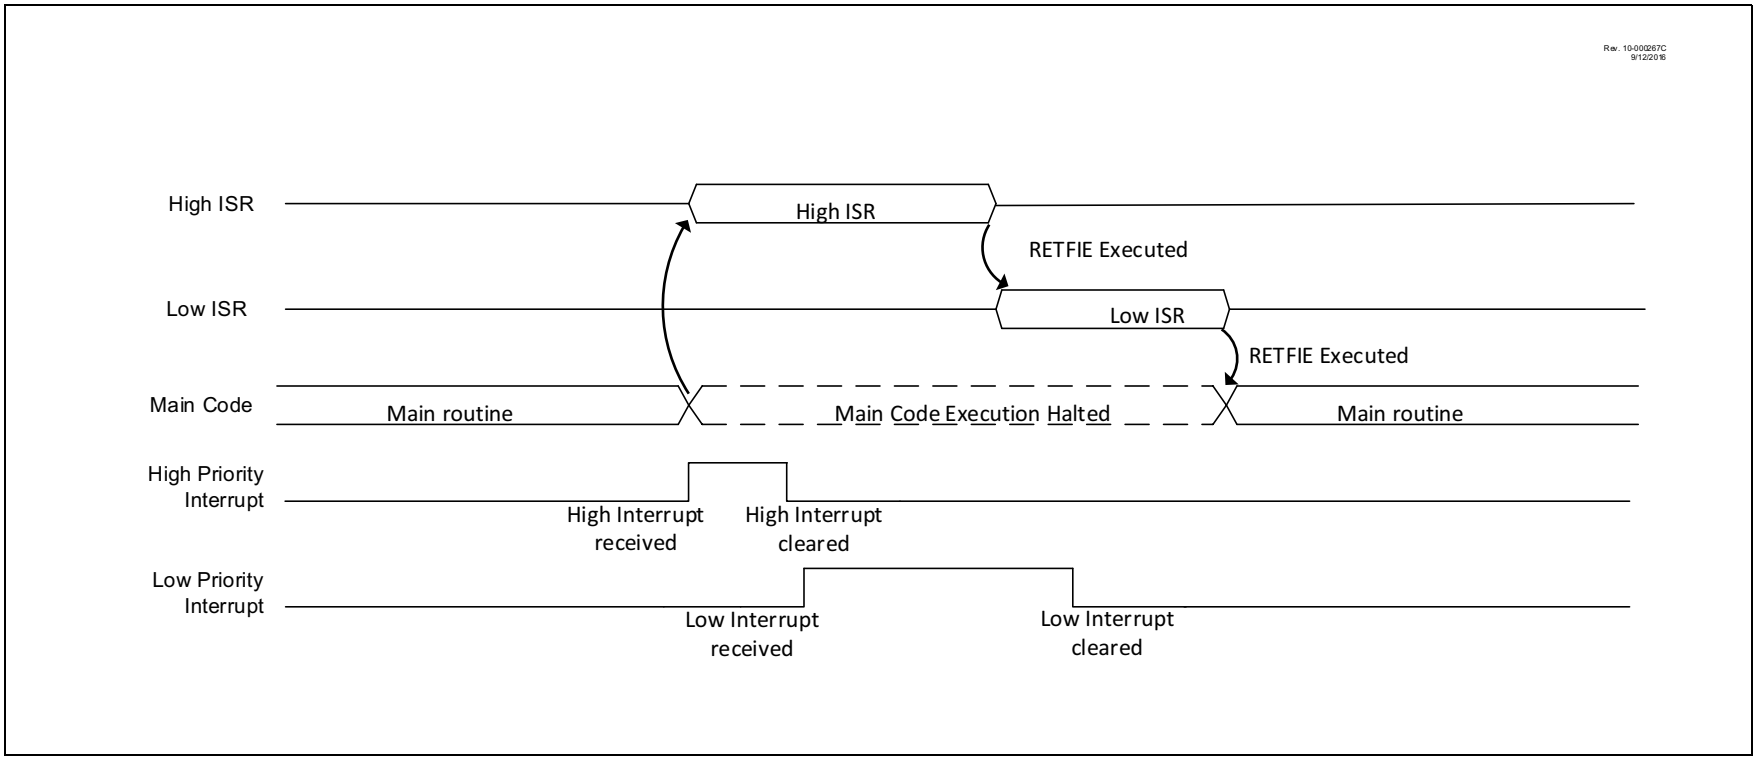
9.4.2 SERVING A HIGH PRIORITY INTERRUPT WHILE A LOW PRIORITY INTERRUPT PENDING

A high priority interrupt request will always take precedence over any interrupt of a lower priority. The high priority interrupt is acknowledged first, then the low-priority interrupt is acknowledged. Upon a return from the high priority ISR (by executing the `RETFIE` instruction), the low priority interrupt is serviced, see Figure 9-3.

If any other high priority interrupts are pending and enabled, then they are serviced before servicing the pending low priority interrupt. If no other high priority interrupt requests are active, the low priority interrupt is serviced.

FIGURE 9-3: INTERRUPT EXECUTION: HIGH PRIORITY INTERRUPT WITH A LOW PRIORITY INTERRUPT PENDING



REGISTER 9-3: PIR0: PERIPHERAL INTERRUPT REQUEST REGISTER 0

R-0/0	R/W/HS-0/0	R/W/HS-0/0	R/W/HS-0/0	R/W/HS-0/0	R/W/HS-0/0	R/W/HS-0/0	R/W/HS-0/0

bit 7							bit 0

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	HS = Bit is set in hardware

bit 7 **IOCIF:** Interrupt-on-Change Interrupt Flag bit(2)
- 1 = Interrupt has occurred
- 0 = Interrupt event has not occurred

bit 6 **CRCIF:** CRC Interrupt Flag bit
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 5 **SCANIF:** Memory Scanner Interrupt Flag bit
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 4 **NVMIF:** NVM Interrupt Flag bit
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 3 **CSWIF:** Clock Switch Interrupt Flag bit(3)
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 2 **OSFIF:** Oscillator Fail Interrupt Flag bit
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 1 **HLVDIF:** HLVD Interrupt Flag bit
- 1 = Interrupt has occurred (must be cleared by software)
- 0 = Interrupt event has not occurred

bit 0 **SWIF:** Software Interrupt Flag bit
- 1 = Software Interrupt Flag Enable
- 0 = Software Interrupt Flag Disable

Note 1: Interrupt flag bits get set when an interrupt condition occurs, regardless of the state of its corresponding enable bit, or the global enable bit. User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt.

2: IOCIF is a read-only bit. To clear the interrupt condition, all bits in the IOCxF registers must be cleared.

3: The CSWIF interrupt will not wake the system from Sleep. The system will sleep until another interrupt causes the wake-up.

10.1.2 INTERRUPTS DURING DOZE

If an interrupt occurs and the Recover-On-Interrupt bit is clear (ROI = 0) at the time of the interrupt, the Interrupt Service Routine (ISR) continues to execute at the rate selected by DOZE<2:0>. Interrupt latency is extended by the DOZE<2:0> ratio.

If an interrupt occurs and the ROI bit is set (ROI = 1) at the time of the interrupt, the DOZEN bit is cleared and the CPU executes at full speed. The prefetched instruction is executed and then the interrupt vector sequence is executed. In Figure 10-1, the interrupt occurs during the 2nd instruction cycle of the Doze period, and immediately brings the CPU out of Doze. If the Doze-On-Exit (DOE) bit is set (DOE = 1) when the RETFIE operation is executed, DOZEN is set, and the CPU executes at the reduced rate based on the DOZE<2:0> ratio.

EXAMPLE 10-1: DOZE SOFTWARE EXAMPLE

```
//Mainline operation
bool somethingToDo = FALSE:
void main()
{
    initializeSystem();
            // DOZE = 64:1 (for example)
            // ROI = 1;
    GIE = 1; // enable interrupts
    while (1)
    {
        // If ADC completed, process data
        if (somethingToDo)
        {
            doSomething();
            DOZEN = 1; // resume low-power
        }
    }
}

// Data interrupt handler
void interrupt()
{
    // DOZEN = 0 because ROI = 1
    if (ADIF)
    {
        somethingToDo = TRUE;
        DOE = 0; // make main() go fast
        ADIF = 0;
    }
    // else check other interrupts...
    if (TMR0IF)
    {
        timerTick++;
        DOE = 1; // make main() go slow
        TMR0IF = 0;
    }
}
```

10.2 Sleep Mode

Sleep mode is entered by executing the SLEEP instruction, while the Idle Enable (IDLEN) bit of the CPUDOZE register is clear (IDLEN = 0).

Upon entering Sleep mode, the following conditions exist:

1. WDT will be cleared but keeps running if enabled for operation during Sleep
2. The $\overline{PD}$ bit of the STATUS register is cleared (Register 4-2)
3. The $\overline{TO}$ bit of the STATUS register is set (Register 4-2)
4. The CPU clock is disabled
5. LFINTOSC, SOSC, HFINTOSC and ADCRC are unaffected and peripherals using them may continue operation in Sleep.
6. I/O ports maintain the status they had before Sleep was executed (driving high, low, or high-impedance)
7. Resets other than WDT are not affected by Sleep mode

Refer to individual chapters for more details on peripheral operation during Sleep.

To minimize current consumption, the following conditions should be considered:

- I/O pins should not be floating
- External circuitry sinking current from I/O pins
- Internal circuitry sourcing current from I/O pins
- Current draw from pins with internal weak pull-ups
- Modules using any oscillator

I/O pins that are high-impedance inputs should be pulled to VDD or VSS externally to avoid switching currents caused by floating inputs.

Examples of internal circuitry that might be sourcing current include modules such as the DAC and FVR modules. See **Section 38.0 “5-Bit Digital-to-Analog Converter (DAC) Module”** and **Section 35.0 “Fixed Voltage Reference (FVR)”** for more information on these modules.

TABLE 11-3: SUMMARY OF REGISTERS ASSOCIATED WITH WINDOWED WATCHDOG TIMER

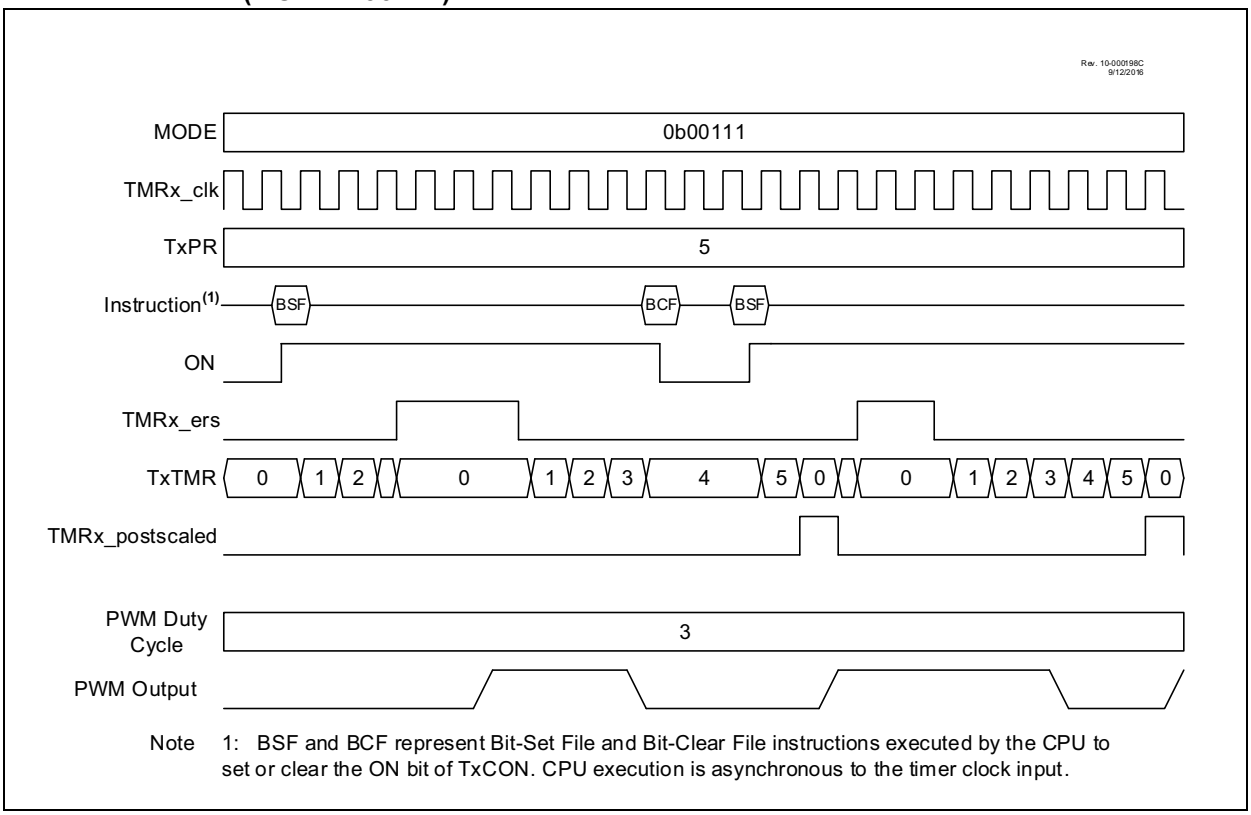
22.5.4 LEVEL-TRIGGERED HARDWARE LIMIT MODE

In the level triggered Hardware Limit Timer modes the counter is reset by high or low levels of the external signal TMR2_ers, as shown in Figure 22-7. Selecting MODE<4:0> = 00110 will cause the timer to reset on a low level external signal. Selecting MODE<4:0> = 00111 will cause the timer to reset on a high level external signal. In the example, the counter is reset while TMR2_ers = 1. ON is controlled by BSF and BCF instructions. When ON=0 the external signal is ignored.

When the CCP uses the timer as the PWM time base then the PWM output will be set high when the timer starts counting and then set low only when the timer count matches the CCPRx value. The timer is reset when either the timer count matches the T2PR value or two clock periods after the external Reset signal goes true and stays true.

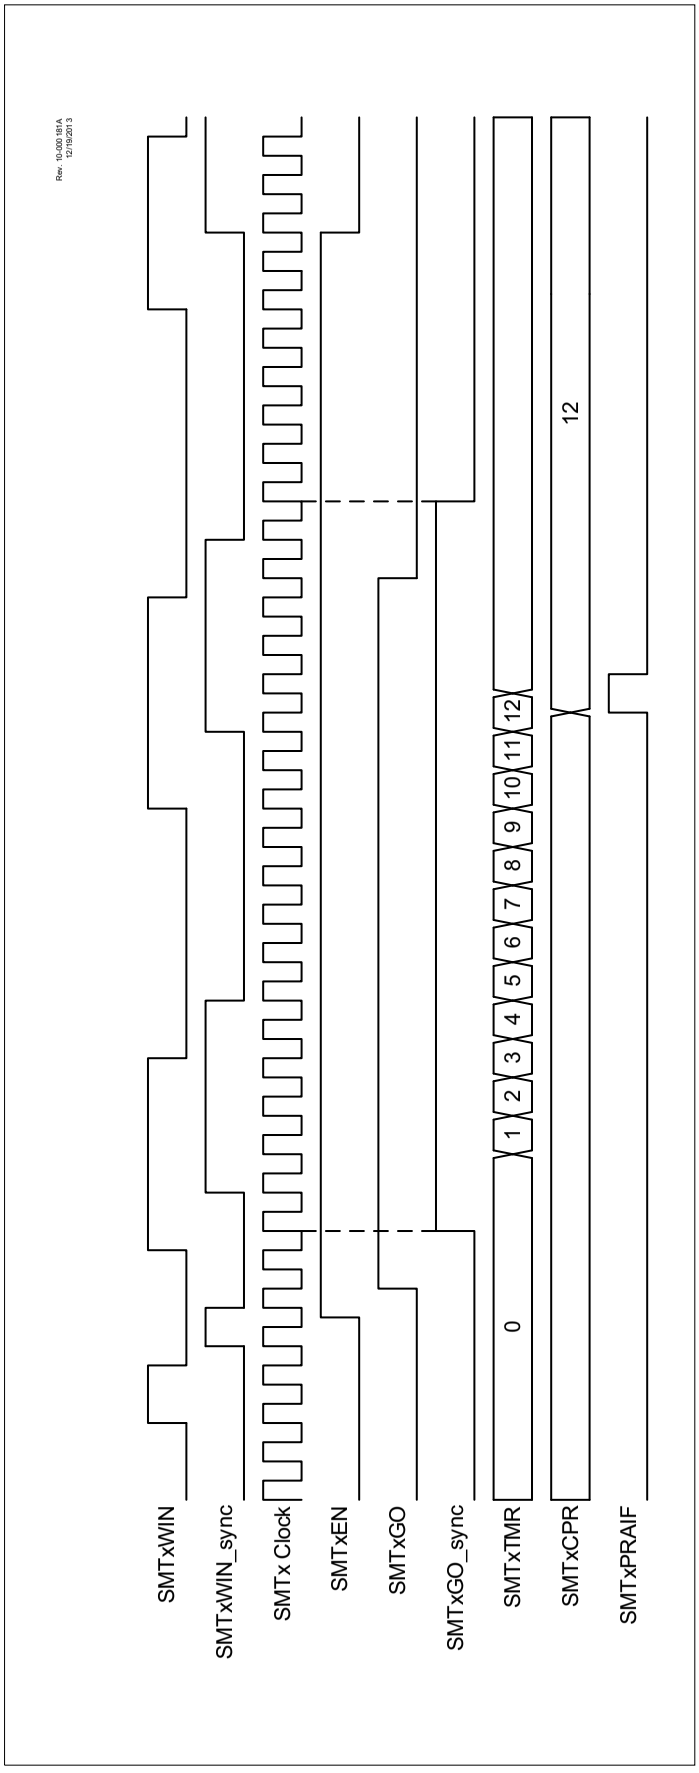
The timer starts counting, and the PWM output is set high, on either the clock following the T2PR match or two clocks after the external Reset signal relinquishes the Reset. The PWM output will remain high until the timer counts up to match the CCPRx pulse width value. If the external Reset signal goes true while the PWM output is high then the PWM output will remain high until the Reset signal is released allowing the timer to count up to match the CCPRx value.

FIGURE 22-7: LEVEL TRIGGERED HARDWARE LIMIT MODE TIMING DIAGRAM (MODE = 00111)



Note 1: BSF and BCF represent Bit-Set File and Bit-Clear File instructions executed by the CPU to set or clear the ON bit of TxCON. CPU execution is asynchronous to the timer clock input.

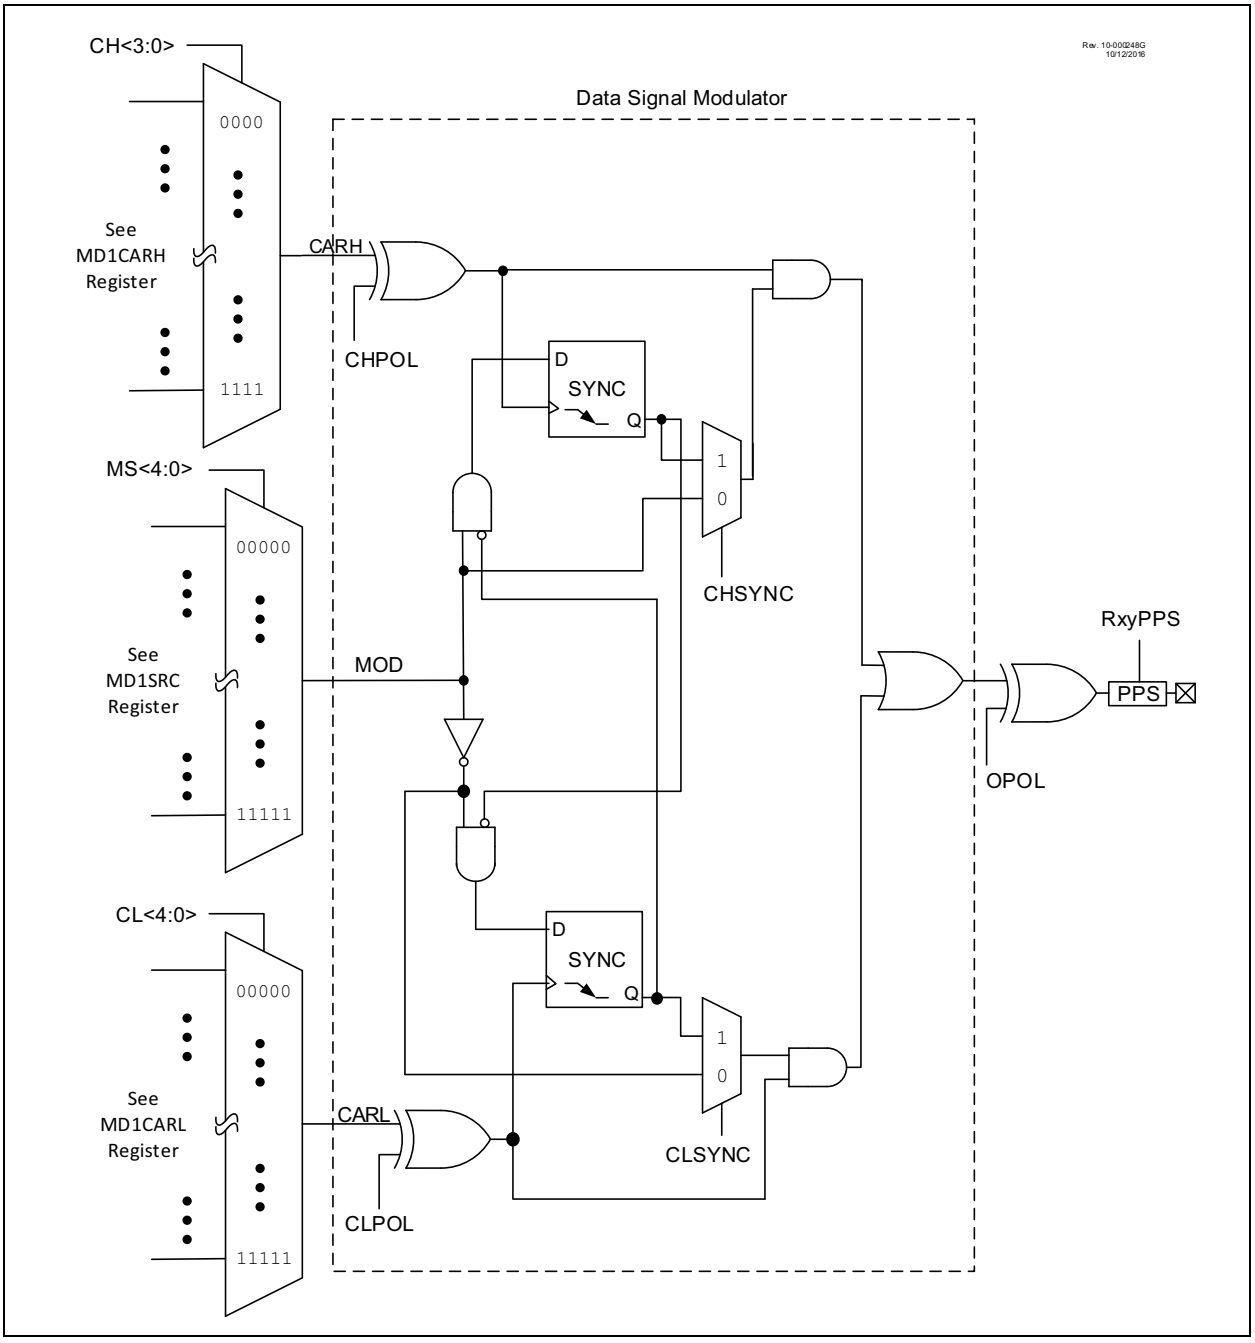
FIGURE 25-11: WINDOWED MEASURE MODE SINGLE ACQUISITION TIMING DIAGRAM



25.6.11 WINDOWED COUNTER MODE

This mode counts pulses on the SMTx_signal input, within a window dictated by the SMTxWIN input. It begins counting upon seeing a rising edge of the SMTxWIN input, updates the SMTxCPW register on a falling edge of the SMTxWIN input, and updates the SMTxCPR register on each rising edge of the SMTxWIN input beyond the first. See Figure 25-21 and Figure 25-22.

FIGURE 30-1: SIMPLIFIED BLOCK DIAGRAM OF THE DATA SIGNAL MODULATOR



34.8.7 INFORMATION PROCESSING TIME

The Information Processing Time (IPT) is the time segment starting at the sample point that is reserved for calculation of the subsequent bit level. The CAN specification defines this time to be less than or equal to 2 TQ. The ECAN module defines this time to be 2 TQ. Thus, Phase Segment 2 must be at least 2 TQ long.

34.8.8 CLOCK SELECTION

The CLKSEL bit of the CIOCON register allows for selection between two CAN input clocks. When CLKSEL = 0 (default), the CAN clock (FOSC in the equations above) will be the same as the system clock. When CLKSEL = 1, the CAN clock will be the clock selected by the FEXTOSC Configuration bit, regardless of the system clock. This allows for the core of the device to be clocked by a PLL at 64 MHz (16 MHz HS crystal+4xPLL) while keeping the CAN clocked by the base 16 MHz HS crystal without the PLL, for example.

Note:	If CLKSEL = 1, the system clock must be greater than or equal to the FEXTOSC selected clock. Having a slower system clock than the CAN clock will lead to unexpected behavior.The Information Processing Time (IPT) is the time segment starting at the sample point that is reserved for calculation of the subsequent bit level. The CAN specification defines this time to be less than or equal to 2 TQ. The CAN module defines this time to be 2 TQ. Thus, Phase Segment 2 must be at least 2 TQ long.

34.9 Synchronization

To compensate for phase shifts between the oscillator frequencies of each of the nodes on the bus, each CAN controller must be able to synchronize to the relevant signal edge of the incoming signal. When an edge in the transmitted data is detected, the logic will compare the location of the edge to the expected time (Sync_Seg). The circuit will then adjust the values of Phase Segment 1 and Phase Segment 2 as necessary. There are two mechanisms used for synchronization.

34.9.1 HARD SYNCHRONIZATION

Hard synchronization is only done when there is a recessive to dominant edge during a bus Idle condition, indicating the start of a message. After hard synchronization, the bit time counters are restarted with Sync_Seg. Hard synchronization forces the edge, which has occurred to lie within the synchronization segment of the restarted bit time. Due to the rules of synchronization, if a hard synchronization occurs, there will not be a resynchronization within that bit time.

34.9.2 RESYNCHRONIZATION

As a result of resynchronization, Phase Segment 1 may be lengthened or Phase Segment 2 may be shortened. The amount of lengthening or shortening of the phase buffer segments has an upper bound given by the Synchronization Jump Width (SJW). The value of the SJW will be added to Phase Segment 1 (see Figure 34-6) or subtracted from Phase Segment 2 (see Figure 34-7). The SJW is programmable between 1 TQ and 4 TQ.

Clocking information will only be derived from recessive to dominant transitions. The property, that only a fixed maximum number of successive bits have the same value, ensures resynchronization to the bit stream during a frame.

The phase error of an edge is given by the position of the edge relative to Sync_Seg, measured in TQ. The phase error is defined in magnitude of TQ as follows:

- e = 0 if the edge lies within Sync_Seg.
- e > 0 if the edge lies before the sample point.
- e < 0 if the edge lies after the sample point of the previous bit.

If the magnitude of the phase error is less than, or equal to, the programmed value of the Synchronization Jump Width, the effect of a resynchronization is the same as that of a hard synchronization.

If the magnitude of the phase error is larger than the Synchronization Jump Width and if the phase error is positive, then Phase Segment 1 is lengthened by an amount equal to the Synchronization Jump Width.

If the magnitude of the phase error is larger than the resynchronization jump width and if the phase error is negative, then Phase Segment 2 is shortened by an amount equal to the Synchronization Jump Width.

34.9.3 SYNCHRONIZATION RULES

- Only one synchronization within one bit time is allowed.
- An edge will be used for synchronization only if the value detected at the previous sample point (previously read bus value) differs from the bus value immediately after the edge.
- All other recessive to dominant edges fulfilling rules 1 and 2 will be used for resynchronization, with the exception that a node transmitting a dominant bit will not perform a resynchronization as a result of a recessive to dominant edge with a positive phase error.

EXAMPLE 34-2: WIN AND ICODE BITS USAGE IN INTERRUPT SERVICE ROUTINE TO ACCESS TX/RX BUFFERS (CONTINUED)

```
ErrorInterrupt
    BCF     PIR3, ERRIF                 ; Clear the interrupt flag

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7 **RXFUL:** Receive Full Status bit(1)
1 = Receive buffer contains a received message
0 = Receive buffer is open to receive a new message

bit 6-5, 6 Mode 0:
RXM<1:0>: Receive Buffer Mode bit 1 (combines with RXM0 to form RXM<1:0> bits, see bit 5)
11 = Receive all messages (including those with errors); filter criteria is ignored
10 = Receive only valid messages with extended identifier; EXIDEN in RXFnSIDL must be '1'
01 = Receive only valid messages with standard identifier, EXIDEN in RXFnSIDL must be '0'
00 = Receive all valid messages as per EXIDEN bit in RXFnSIDL register
Mode 1, 2:
RXM1: Receive Buffer Mode bit
1 = Receive all messages (including those with errors); acceptance filters are ignored
0 = Receive all valid messages as per acceptance filters

bit 5 Mode 0:
RXM<1:0>: Receive Buffer Mode bit 0 (combines with RXM1 to form RXM<1:0> bits, see bit 6)
Mode 1, 2:
RTRRO: Remote Transmission Request bit for Received Message (read-only)
1 = A remote transmission request is received
0 = A remote transmission request is not received

bit 4 Mode 0:
FILHIT2**4:** Filter Hit bit 4
Mode 1, 2:
FILHIT<4:0>: Filter Hit bit 4
This bit combines with other bits to form the filter acceptance bits<4:0>.

bit 3 Mode 0:
RXRTRRO: Remote Transmission Request bit for Received Message (read-only)
1 = A remote transmission request is received
0 = A remote transmission request is not received
Mode 1, 2:
FILHIT<4:0>: Filter Hit bit 3
This bit combines with other bits to form the filter acceptance bits<4:0>.

Note 1: This bit is set by the CAN module upon receiving a message and must be cleared by software after the buffer is read. As long as RXFUL is set, no new message will be loaded and the buffer will be considered full.

	bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7-0 **F<15:2>BP_<3:0>:** Filter n Buffer Pointer Nibble bits

0000 = Filter n is associated with RXB0
0001 = Filter n is associated with RXB1
0010 = Filter n is associated with B0
0011 = Filter n is associated with B1
...
0111 = Filter n is associated with B5
1111-1000 = Reserved

Note 1: This register is available in Mode 1 and 2 only.

39.13 Register Definitions: Comparator Control

Long bit name prefixes for the Comparators are shown in Table 39-2. Refer to **Section 1.3.2.2 "Long Bit Names"** for more information.

TABLE 39-2:

Peripheral	Bit Name Prefix
C1	C1
C2	C2

REGISTER 39-1: CMxCON0: COMPARATOR x CONTROL REGISTER 0

R/W-0/0	R-0/0	U-0	R/W-0/0	U-0	U-1	R/W-0/0	R/W-0/0
EN	OUT	—	POL	—	—	HYS	SYNC
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7 **EN:** Comparator Enable bit
- 1 = Comparator is enabled
- 0 = Comparator is disabled and consumes no active power

bit 6 **OUT:** Comparator Output bit

If POL = 0 (noninverted polarity):
- 1 = CxVP > CxVN
- 0 = CxVP < CxVN

If POL = 1 (inverted polarity):
- 1 = CxVP < CxVN
- 0 = CxVP > CxVN

bit 5 **Unimplemented:** Read as '0'

bit 4 **POL:** Comparator Output Polarity Select bit
- 1 = Comparator output is inverted
- 0 = Comparator output is not inverted

bit 3 **Unimplemented:** Read as '0'

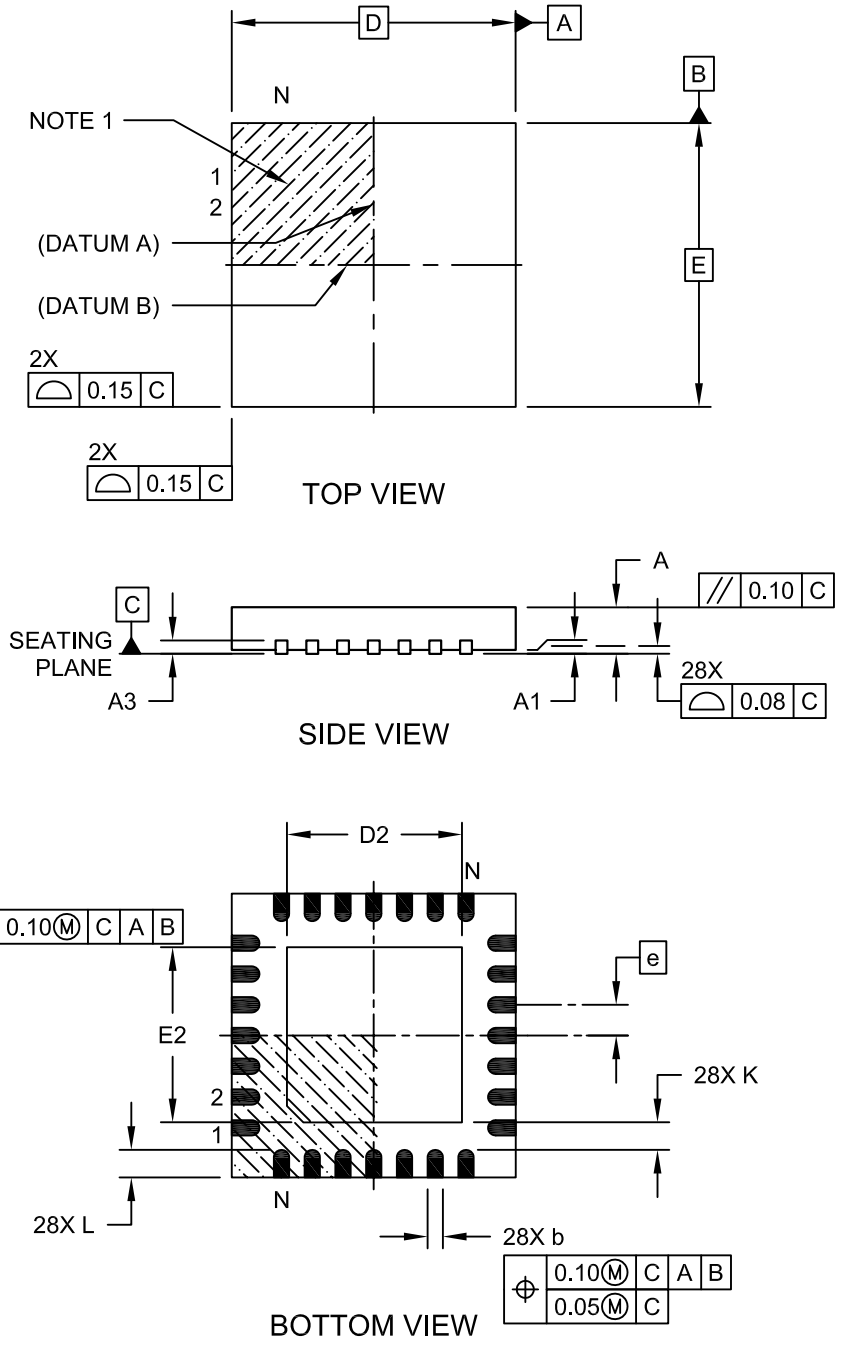
bit 2 **Unimplemented:** Read as '1'

bit 1 **HYS:** Comparator Hysteresis Enable bit
- 1 = Comparator hysteresis enabled
- 0 = Comparator hysteresis disabled

bit 0 **SYNC:** Comparator Output Synchronous Mode bit
- 1 = Comparator output to Timer1/3/5 and I/O pin is synchronous to changes on Timer1 clock source.
- 0 = Comparator output to Timer1/3/5 and I/O pin is asynchronous
  Output updated on the falling edge of Timer1/3/5 clock source.

28-Lead Plastic Quad Flat, No Lead Package (ML) - 6x6 mm Body [QFN]
With 0.55 mm Terminal Length

Note:	For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



Microchip Technology Drawing C04-105C Sheet 1 of 2

REVISION HISTORY

Revision A (8/2017)

Initial release of the document.
