Intel - 10AS027E2F29E1HG Datasheet

Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems

Embedded - System On Chip (SoC) refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

What are Embedded - System On Chip (SoC)?

System On Chip (SoC) integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

Details	
Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I²C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 270K Logic Elements
Operating Temperature	0°C ~ 100°C (TJ)
Package / Case	780-BBGA, FCBGA
Supplier Device Package	780-FBGA, FC (29x29)
Purchase URL	https://www.e-xfl.com/product-detail/intel/10as027e2f29e1hg

Contents

Feature	Description	
Embedded Hard IP blocks	Variable-precision DSP	• Native support for signal processing precision levels from 18 x 19 to 54 x 54 • Native support for 27 x 27 multiplier mode • 64-bit accumulator and cascade for systolic finite impulse responses (FIRs) • Internal coefficient memory banks • Preadder/subtractor for improved efficiency • Additional pipeline register to increase performance and reduce power • Supports floating point arithmetic: — Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication. — Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability. — Dynamic accumulator reset control. — Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.
	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port
	Transceiver I/O	• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC) • PCS hard IPs that support: — 10-Gbps Ethernet (10GbE) — PCIe PIPE interface — Interlaken — Gbps Ethernet (GbE) — Common Public Radio Interface (CPRI) with deterministic latency support — Gigabit-capable passive optical network (GPON) with fast lock-time support • 13.5G JESD204b • 8B/10B, 64B/66B, 64B/67B encoders and decoders • Custom mode support for proprietary protocols
Core clock networks	• Up to 800 MHz fabric clocking, depending on the application: — 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface — 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface • Global, regional, and peripheral clock networks • Clock networks that are not used can be gated to reduce dynamic power	
Phase-locked loops (PLLs)	• High-resolution fractional synthesis PLLs: — Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB) — Support integer mode and fractional mode — Fractional mode support with third-order delta-sigma modulation • Integer PLLs: — Adjacent to general purpose I/Os — Support external memory and LVDS interfaces	
FPGA General-purpose I/Os (GPIOs)	• 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter • On-chip termination (OCT) • 1.2 V to 3.0 V single-ended LVTTL/LVCMOS interfacing	
External Memory Interface	• Hard memory controller— DDR4, DDR3, and DDR3L support — DDR4—speeds up to 1,200 MHz/2,400 Mbps — DDR3—speeds up to 1,067 MHz/2,133 Mbps • Soft memory controller—provides support for RLDRAM 3(2), QDR IV(2), and QDR II+	

continued...

Feature	Description	
Low-power serial transceivers	• Continuous operating range: — Intel Arria 10 GX—1 Gbps to 17.4 Gbps — Intel Arria 10 GT—1 Gbps to 25.8 Gbps • Backplane support: — Intel Arria 10 GX—up to 12.5 — Intel Arria 10 GT—up to 12.5 • Extended range down to 125 Mbps with oversampling • ATX transmit PLLs with user-configurable fractional synthesis capability • Electronic Dispersion Compensation (EDC) support for XFP, SFP+, QSFP, and CFP optical module • Adaptive linear and decision feedback equalization • Transmitter pre-emphasis and de-emphasis • Dynamic partial reconfiguration of individual transceiver channels	
HPS (Intel Arria 10 SX devices only)	Processor and system	• Dual-core ARM Cortex-A9 MPCore processor—1.2 GHz CPU with 1.5 GHz overdrive capability • 256 KB on-chip RAM and 64 KB on-chip ROM • System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers • Security features—anti-tamper, secure boot, Advanced Encryption Standard (AES) and authentication (SHA) • ARM CoreSight* JTAG debug access port, trace port, and on-chip trace storage
	External interfaces	• Hard memory interface—Hard memory controller (2,400 Mbps DDR4, and 2,133 Mbps DDR3), Quad serial peripheral interface (QSPI) flash controller, NAND flash controller, direct memory access (DMA) controller, Secure Digital/MultiMediaCard (SD/MMC) controller • Communication interface— 10/100/1000 Ethernet media access control (MAC), USB On-The-GO (OTG) controllers, I^{2}C controllers, UART 16550, serial peripheral interface (SPI), and up to 62 HPS GPIO interfaces (48 direct-share I/Os)
	Interconnects to core	• High-performance ARM AMBA* AXI bus bridges that support simultaneous read and write • HPS–FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa • Configuration bridge that allows HPS configuration manager to configure the core logic via dedicated 32-bit configuration port • FPGA-to-HPS SDRAM controller bridge—provides configuration interfaces for the multiport front end (MPFE) of the HPS SDRAM controller
Configuration	• Tamper protection—comprehensive design protection to protect your valuable IP investments • Enhanced 256-bit advanced encryption standard (AES) design security with authentication • Configuration via protocol (CvP) using PCIe Gen1, Gen2, or Gen3

I/O Vertical Migration for Intel Arria 10 Devices

Figure 4. Migration Capability Across Intel Arria 10 Product Lines

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

Note: To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
  - Conventional integer mode equivalent to the general purpose PLL
  - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
  - Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
  - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage (V_{OD}) and programmable pre-emphasis

- Series (R_S) and parallel (R_T) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

External Memory Interface Spec Estimator
Provides a parametric tool that allows you to find and compare the performance of the supported external memory interfaces in IntelFPGAs.

Memory Standards Supported by Intel Arria 10 Devices

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

The scalable hard IP supports multiple independent 10GbE ports while using a single PLL for all the 10GBASE-R PCS instantiations, which saves on core logic resources and clock networks:

- Simplifies multiport 10GbE systems compared to XAUI interfaces that require an external XAUI-to-10G PHY.
- Incorporates Electronic Dispersion Compensation (EDC), which enables direct connection to standard 10 Gbps XFP and SFP+ pluggable optical modules.
- Supports backplane Ethernet applications and includes a hard 10GBASE-KR Forward Error Correction (FEC) circuit that you can use for 10 Gbps and 40 Gbps applications.

The 10 Gbps Ethernet PCS hard IP and 10GBASE-KR FEC are present in every transceiver channel.

Related Information

PCS Features on page 30

Low Power Serial Transceivers

Intel Arria 10 FPGAs and SoCs include lowest power transceivers that deliver high bandwidth, throughput and low latency.

Intel Arria 10 devices deliver the industry's lowest power consumption per transceiver channel:

- 12.5 Gbps transceivers at as low as 242 mW
- 10 Gbps transceivers at as low as 168 mW
- 6 Gbps transceivers at as low as 117 mW

Intel Arria 10 transceivers support various data rates according to application:

- Chip-to-chip and chip-to-module applications—from 1 Gbps up to 25.8 Gbps
- Long reach and backplane applications—from 1 Gbps up to 12.5 with advanced adaptive equalization
- Critical power sensitive applications—from 1 Gbps up to 11.3 Gbps using lower power modes

The combination of 20 nm process technology and architectural advances provide the following benefits:

- Significant reduction in die area and power consumption
- Increase of up to two times in transceiver I/O density compared to previous generation devices while maintaining optimal signal integrity
- Up to 72 total transceiver channels—you can configure up to 6 of these channels to run as fast as 25.8 Gbps
- All channels feature continuous data rate support up to the maximum rated speed

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices

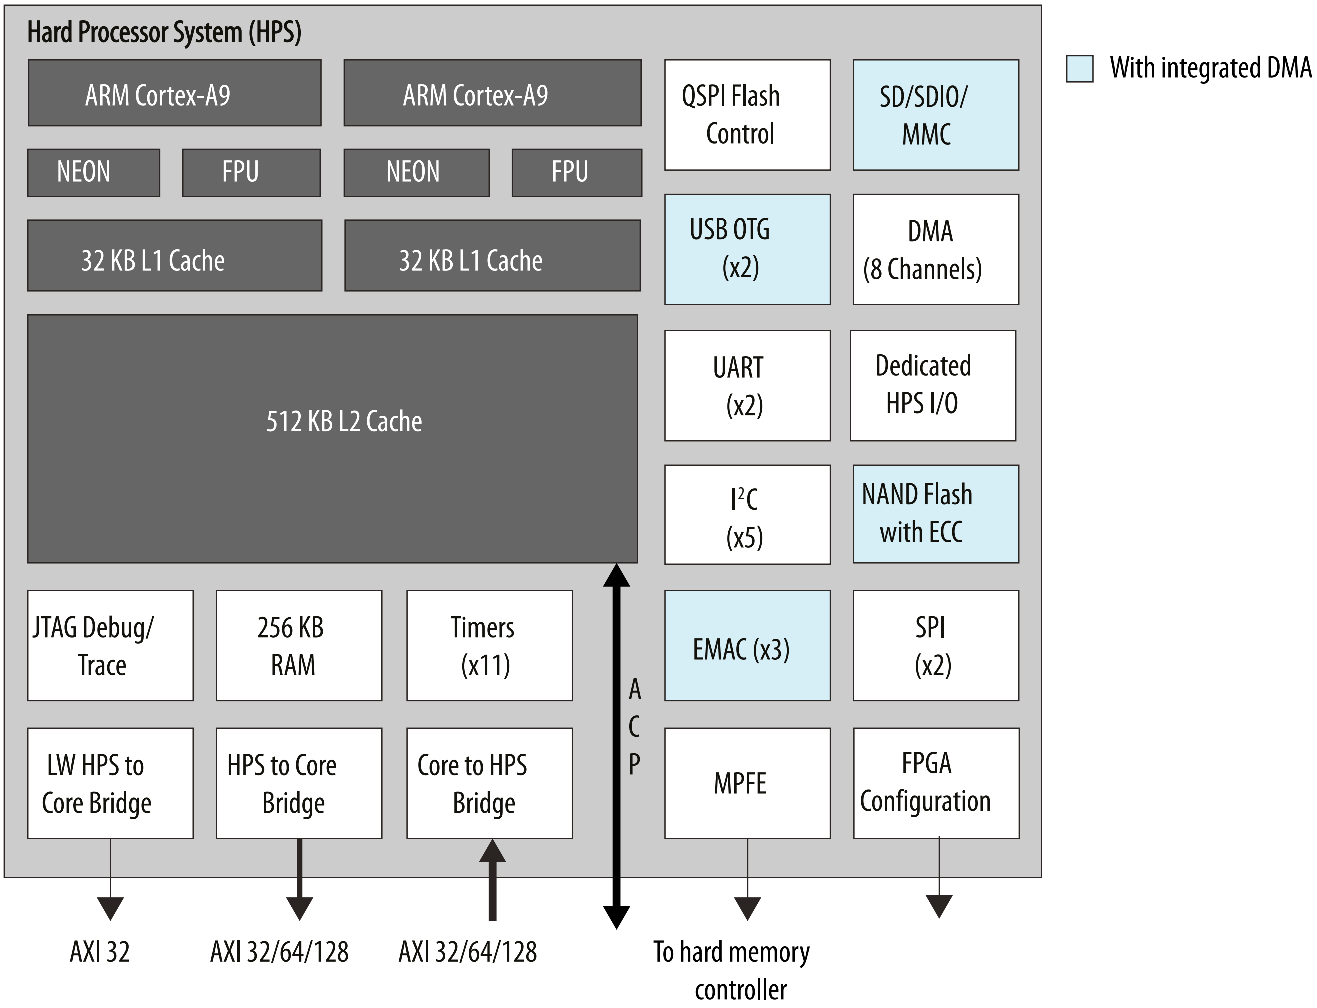
Feature	Capability
Chip-to-Chip Data Rates	1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices) 1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices)
Backplane Support	Drive backplanes at data rates up to 12.5 Gbps
Optical Module Support	SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4
Cable Driving Support	SFP+ Direct Attach, PCI Express over cable, eSATA
Transmit Pre-Emphasis	4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss
Continuous Time Linear Equalizer (CTLE)	Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss
Decision Feedback Equalizer (DFE)	7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments
Variable Gain Amplifier	Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes
Altera Digital Adaptive Parametric Tuning (ADAPT)	Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic
Precision Signal Integrity Calibration Engine (PreSICE)	Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance
Advanced Transmit (ATX) PLL	Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols
Fractional PLLs	On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost
Digitally Assisted Analog CDR	Superior jitter tolerance with fast lock time
Dynamic Partial Reconfiguration	Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility
Multiple PCS-PMA and PCS-PLD interface widths	8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency

PCS Features

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

Figure 9. HPS Block Diagram

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.



Key Advantages of 20-nm HPS

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

System Peripherals and Debug Access Port

Each Ethernet MAC, USB OTG, NAND flash controller, and SD/MMC controller module has an integrated DMA controller. For modules without an integrated DMA controller, an additional DMA controller module provides up to eight channels of high-bandwidth data transfers. Peripherals that communicate off-chip are multiplexed with other peripherals at the HPS pin level. This allows you to choose which peripherals interface with other devices on your PCB.

The debug access port provides interfaces to industry standard JTAG debug probes and supports ARM CoreSight debug and core traces to facilitate software development.

HPS–FPGA AXI Bridges

The HPS–FPGA bridges, which support the Advanced Microcontroller Bus Architecture (AMBA) Advanced eXtensible Interface (AXI™) specifications, consist of the following bridges:

- FPGA-to-HPS AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the FPGA fabric to issue transactions to slaves in the HPS.
- HPS-to-FPGA Avalon/AMBA AXI bridge—a high-performance bus supporting 32, 64, and 128 bit data widths that allows the HPS to issue transactions to slaves in the FPGA fabric.
- Lightweight HPS-to-FPGA AXI bridge—a lower latency 32 bit width bus that allows the HPS to issue transactions to soft peripherals in the FPGA fabric. This bridge is primarily used for control and status register (CSR) accesses to peripherals in the FPGA fabric.

The HPS–FPGA AXI bridges allow masters in the FPGA fabric to communicate with slaves in the HPS logic, and vice versa. For example, the HPS-to-FPGA AXI bridge allows you to share memories instantiated in the FPGA fabric with one or both microprocessors in the HPS, while the FPGA-to-HPS AXI bridge allows logic in the FPGA fabric to access the memory and peripherals in the HPS.

Each HPS–FPGA bridge also provides asynchronous clock crossing for data transferred between the FPGA fabric and the HPS.

HPS SDRAM Controller Subsystem

The HPS SDRAM controller subsystem contains a multiport SDRAM controller and DDR PHY that are shared between the FPGA fabric (through the FPGA-to-HPS SDRAM interface), the level 2 (L2) cache, and the level 3 (L3) system interconnect. The FPGA-to-HPS SDRAM interface supports AMBA AXI and Avalon® Memory-Mapped (Avalon-MM) interface standards, and provides up to six individual ports for access by masters implemented in the FPGA fabric.

The HPS SDRAM controller supports up to 3 masters (command ports), 3x 64-bit read data ports and 3x 64-bit write data ports.

To maximize memory performance, the SDRAM controller subsystem supports command and data reordering, deficit round-robin arbitration with aging, and high-priority bypass features.

FPGA Configuration and HPS Booting

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux*, VxWorks*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

Dynamic and Partial Reconfiguration

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

Dynamic Reconfiguration

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

Partial Reconfiguration

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

Date	Version	Changes
		- Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from *Sample Ordering Core and Available Options for Intel Arria 10 GT Devices* figure. - Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps. - Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from *PMA Features of the Transceivers in Intel Arria 10 Devices* table.
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	- Corrected protocol names with "1588" to "IEEE 1588v2". - Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants. - Removed all "Preliminary" marks.
March 2017	2017.03.15	- Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices. - Rebranded as Intel.
October 2016	2016.10.31	- Removed package F36 from Intel Arria 10 GX devices. - Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.
May 2016	2016.05.02	- Updated the FPGA Configuration and HPS Booting topic. - Remove V_{CC} PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices. - Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA. - Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.
February 2016	2016.02.11	- Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally. - Revised the state for Core clock networks in the Summary of Features topic. - Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table. - Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table. - Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table. - Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure. - Changed transceiver parameters in the "Low Power Serial Transceivers" section. - Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table. - Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure. - Changed the datarates for GT devices in the "PMA Features" section. - Changed the datarates for GT devices in the "PCS Features" section.

continued...

Date	Version	Changes
August 2014	2014.08.18	- Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620. - Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table. - Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration. - Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller. - Added variable precision DSP blocks support for floating-point arithmetic.
June 2014	2014.06.19	Updated number of dedicated I/Os in the HPS block to 17.
February 2014	2014.02.21	Updated transceiver speed grade options for GT devices in Figure 2.
February 2014	2014.02.06	Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.
December 2013	2013.12.10	- Updated the HPS memory standards support from LPDDR2 to LPDDR3. - Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .
December 2013	2013.12.02	Initial release.
