### **Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems**

**Embedded - System On Chip (SoC)** refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

### **What are Embedded - System On Chip (SoC)?**

**System On Chip (SoC)** integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

#### **Details**

Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I <sup>2</sup> C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 270K Logic Elements
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FBGA, FC (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/10as027h4f34i3sg">https://www.e-xfl.com/product-detail/intel/10as027h4f34i3sg</a>

## Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

**Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices**

Market	Applications
Wireless	<ul style="list-style-type: none"> <li>• Channel and switch cards in remote radio heads</li> <li>• Mobile backhaul</li> </ul>
Wireline	<ul style="list-style-type: none"> <li>• 40G/100G muxponders and transponders</li> <li>• 100G line cards</li> <li>• Bridging</li> <li>• Aggregation</li> </ul>
Broadcast	<ul style="list-style-type: none"> <li>• Studio switches</li> <li>• Servers and transport</li> <li>• Videoconferencing</li> <li>• Professional audio and video</li> </ul>
Computing and Storage	<ul style="list-style-type: none"> <li>• Flash cache</li> <li>• Cloud computing servers</li> <li>• Server acceleration</li> </ul>
Medical	<ul style="list-style-type: none"> <li>• Diagnostic scanners</li> <li>• Diagnostic imaging</li> </ul>
Military	<ul style="list-style-type: none"> <li>• Missile guidance and control</li> <li>• Radar</li> <li>• Electronic warfare</li> <li>• Secure communications</li> </ul>

continued...												

<sup>(8)</sup> The number of GPIOs does not include transceiver I/Os. In the Intel Quartus Prime software, the number of user I/Os includes transceiver I/Os.

<sup>(9)</sup> Each LVDS I/O pair can be used as differential input or output.

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

**Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices**

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

**Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices**

The table lists the variable-precision DSP resources by bit precision for each Intel Arria 10 device.

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input

## Embedded Memory Blocks

The embedded memory blocks in the devices are flexible and designed to provide an optimal amount of small- and large-sized memory arrays to fit your design requirements.

## Types of Embedded Memory

The Intel Arria 10 devices contain two types of memory blocks:

- 20 Kb M20K blocks—blocks of dedicated memory resources. The M20K blocks are ideal for larger memory arrays while still providing a large number of independent ports.
- 640 bit memory logic array blocks (MLABs)—enhanced memory blocks that are configured from dual-purpose logic array blocks (LABs). The MLABs are ideal for wide and shallow memory arrays. The MLABs are optimized for implementation of shift registers for digital signal processing (DSP) applications, wide and shallow FIFO buffers, and filter delay lines. Each MLAB is made up of ten adaptive logic modules (ALMs). In the Intel Arria 10 devices, you can configure these ALMs as ten 32 x 2 blocks, giving you one 32 x 20 simple dual-port SRAM block per MLAB.

## Embedded Memory Capacity in Intel Arria 10 Devices

**Table 18. Embedded Memory Capacity and Distribution in Intel Arria 10 Devices**

Variant	Product Line	M20K		MLAB		Total RAM Bit (Kb)
		Block	RAM Bit (Kb)	Block	RAM Bit (Kb)	
Intel Arria 10 GX	GX 160	440	8,800	1,680	1,050	9,850

	SX 660	2,131	42,620	9,260	5,788	48,408

**Figure 6. Intel Arria 10 Transceiver Block Architecture**

## Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

PCS	Description
Standard PCS	<ul style="list-style-type: none"> <li>Operates at a data rate up to 12 Gbps</li> <li>Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS</li> <li>Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.</li> </ul>
Enhanced PCS	<ul style="list-style-type: none"> <li>Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA</li> <li>Handles data transfer to and from the FPGA fabric</li> <li>Handles data transfer internally to and from the PMA</li> <li>Provides frequency compensation</li> <li>Performs channel bonding for multi-channel low skew applications</li> </ul>
PCIe Gen3 PCS	<ul style="list-style-type: none"> <li>Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates</li> <li>Provides support for PIPE 3.0 features</li> <li>Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed</li> </ul>

## PCS Protocol Support

This table lists some of the protocols supported by the Intel Arria 10 transceiver PCS. For more information about the blocks in the transmitter and receiver data paths, refer to the related information.

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
PCIe Gen3 x1, x2, x4, x8	8.0	Native PHY (PIPE)	Standard PCS and PCIe Gen3 PCS
PCIe Gen2 x1, x2, x4, x8	5.0	Native PHY (PIPE)	Standard PCS
PCIe Gen1 x1, x2, x4, x8	2.5	Native PHY (PIPE)	Standard PCS
1000BASE-X Gigabit Ethernet	1.25	Native PHY	Standard PCS
1000BASE-X Gigabit Ethernet with IEEE 1588v2	1.25	Native PHY	Standard PCS
10GBASE-R	10.3125	Native PHY	Enhanced PCS
10GBASE-R with IEEE 1588v2	10.3125	Native PHY	Enhanced PCS
10GBASE-R with KR FEC	10.3125	Native PHY	Enhanced PCS
10GBASE-KR and 1000BASE-X	10.3125	1G/10GbE and 10GBASE-KR PHY	Standard PCS and Enhanced PCS
Interlaken (CEI-6G/11G)	3.125 to 17.4	Native PHY	Enhanced PCS
SFI-S/SFI-5.2	11.2	Native PHY	Enhanced PCS
10G SDI	10.692	Native PHY	Enhanced PCS
continued...			

Protocol	Data Rate (Gbps)	Transceiver IP	PCS Support
CPRI 6.0 (64B/66B)	0.6144 to 10.1376	Native PHY	Enhanced PCS
CPRI 4.2 (8B/10B)	0.6144 to 9.8304	Native PHY	Standard PCS
OBSAI RP3 v4.2	0.6144 to 6.144	Native PHY	Standard PCS
SD-SDI/HD-SDI/3G-SDI	0.143 <sup>(12)</sup> to 2.97	Native PHY	Standard PCS

## SoC with Hard Processor System

Each SoC device combines an FPGA fabric and a hard processor system (HPS) in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

---

<sup>(12)</sup> The 0.143 Gbps data rate is supported using oversampling of user logic that you must implement in the FPGA fabric.

**Table 24. Improvements in 20 nm HPS**

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC: <ul style="list-style-type: none"><li>• 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC.</li><li>• 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time.</li><li>• Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.</li></ul>
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I <sup>2</sup> C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power. You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

## FPGA Configuration and HPS Booting

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

## Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux\*, VxWorks\*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

## Dynamic and Partial Reconfiguration

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

### Dynamic Reconfiguration

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

### Partial Reconfiguration

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

Instead of placing all device functions in the FPGA fabric, you can store some functions that do not run simultaneously in external memory and load them only when required. This capability increases the effective logic density of the device, and lowers cost and power consumption.

In the Intel solution, you do not have to worry about intricate device architecture to perform a partial reconfiguration. The partial reconfiguration capability is built into the Intel Quartus Prime design software, making such time-intensive task simple.

Intel Arria 10 devices support partial reconfiguration in the following configuration options:

- Using an internal host:
  - All supported configuration modes where the FPGA has access to external memory devices such as serial and parallel flash memory.
  - Configuration via Protocol [CvP (PCIe)]
- Using an external host—passive serial (PS), fast passive parallel (FPP) x8, FPP x16, and FPP x32 I/O interface.

## Enhanced Configuration and Configuration via Protocol

**Table 25. Configuration Schemes and Features of Intel Arria 10 Devices**

Intel Arria 10 devices support 1.8 V programming voltage and several configuration schemes.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps) <sup>(13)</sup>	Decompression	Design Security <sup>(14)</sup>	Partial Reconfiguration <sup>(15)</sup>	Remote System Update
JTAG	1 bit	33	33	—	—	Yes <sup>(16)</sup>	—
Active Serial (AS) through the EPCQ-L configuration device	1 bit, 4 bits	100	400	Yes	Yes	Yes <sup>(16)</sup>	Yes
Passive serial (PS) through CPLD or external microcontroller	1 bit	100	100	Yes	Yes	Yes <sup>(16)</sup>	Parallel Flash Loader (PFL) IP core

*continued...*

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(16)</sup> Partial configuration can be performed only when it is configured as internal host.

Scheme	Data Width	Max Clock Rate (MHz)	Max Data Rate (Mbps) <sup>(13)</sup>	Decompression	Design Security <sup>(14)</sup>	Partial Reconfiguration <sup>(15)</sup>	Remote System Update
Fast passive parallel (FPP) through CPLD or external microcontroller	8 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	PFL IP core
	16 bits			Yes	Yes		
	32 bits			Yes	Yes		
Configuration via HPS	16 bits	100	3200	Yes	Yes	Yes <sup>(17)</sup>	—
	32 bits			Yes	Yes		
Configuration via Protocol [CvP (PCIe*)]	x1, x2, x4, x8 lanes	—	8000	Yes	Yes	Yes <sup>(16)</sup>	—

You can configure Intel Arria 10 devices through PCIe using Configuration via Protocol (CvP). The Intel Arria 10 CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

## SEU Error Detection and Correction

Intel Arria 10 devices offer robust and easy-to-use single-event upset (SEU) error detection and correction circuitry.

The detection and correction circuitry includes protection for Configuration RAM (CRAM) programming bits and user memories. The CRAM is protected by a continuously running CRC error detection circuit with integrated ECC that automatically corrects one or two errors and detects higher order multi-bit errors. When more than two errors occur, correction is available through reloading of the core programming file, providing a complete design refresh while the FPGA continues to operate.

The physical layout of the Intel Arria 10 CRAM array is optimized to make the majority of multi-bit upsets appear as independent single-bit or double-bit errors which are automatically corrected by the integrated CRAM ECC circuitry. In addition to the CRAM protection, the M20K memory blocks also include integrated ECC circuitry and are layout-optimized for error detection and correction. The MLAB does not have ECC.

## Power Management

Intel Arria 10 devices leverage the advanced 20 nm process technology, a low 0.9 V core power supply, an enhanced core architecture, and several optional power reduction techniques to reduce total power consumption by as much as 40% compared to Arria V devices and as much as 60% compared to Stratix V devices.

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(17)</sup> Supported at a maximum clock rate of 100 MHz.

The optional power reduction techniques in Intel Arria 10 devices include:

- **SmartVID**—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core  $V_{CC}$  while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

## Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

## Document Revision History for Intel Arria 10 Device Overview

Document Version	Changes
2018.04.09	Updated the lowest $V_{CC}$ from 0.83 V to 0.82 V in the topic listing a summary of the device features.

Date	Version	Changes
January 2018	2018.01.17	<ul style="list-style-type: none"><li>• Updated the maximum data rate for HPS (Intel Arria 10 SX devices external memory interface DDR3 controller from 2,166 Mbps to 2,133 Mbps.</li><li>• Updated maximum frequency supported for half rate QDR II and QDR II + SRAM to 633 MHz in <i>Memory Standards Supported by the Soft Memory Controller</i> table.</li><li>• Updated transceiver backplane capability to 12.5 Gbps.</li><li>• Removed transceiver speed grade 5 in <i>Sample Ordering Core and Available Options for Intel Arria 10 GX Devices</i> figure.</li></ul>
continued...		

Date	Version	Changes
		<ul style="list-style-type: none"> <li>Removed package code 40, low static power, SmartVID, industrial, and military operating temperature support from <i>Sample Ordering Core and Available Options for Intel Arria 10 GT Devices</i> figure.</li> <li>Updated short reach transceiver rate for Intel Arria 10 GT devices to 25.8 Gbps.</li> <li>Removed On-Die Instrumentation — EyeQ and Jitter Margin Tool support from <i>PMA Features of the Transceivers in Intel Arria 10 Devices</i> table.</li> </ul>
September 2017	2017.09.20	Updated the maximum speed of the DDR4 external memory interface from 1,333 MHz/2,666 Mbps to 1,200 MHz/2,400 Mbps.
July 2017	2017.07.13	Corrected the automotive temperature range in the figure showing the available options for the Intel Arria 10 GX devices from "-40°C to 100°C" to "-40°C to 125°C".
July 2017	2017.07.06	Added automotive temperature option to Intel Arria 10 GX device family.
May 2017	2017.05.08	<ul style="list-style-type: none"> <li>Corrected protocol names with "1588" to "IEEE 1588v2".</li> <li>Updated the vertical migration table to remove vertical migration between Intel Arria 10 GX and Intel Arria 10 SX device variants.</li> <li>Removed all "Preliminary" marks.</li> </ul>
March 2017	2017.03.15	<ul style="list-style-type: none"> <li>Removed the topic about migration from Intel Arria 10 to Intel Stratix 10 devices.</li> <li>Rebranded as Intel.</li> </ul>
October 2016	2016.10.31	<ul style="list-style-type: none"> <li>Removed package F36 from Intel Arria 10 GX devices.</li> <li>Updated Intel Arria 10 GT sample ordering code and maximum GX transceiver count. Intel Arria 10 GT devices are available only in the SF45 package option with a maximum of 72 transceivers.</li> </ul>
May 2016	2016.05.02	<ul style="list-style-type: none"> <li>Updated the FPGA Configuration and HPS Booting topic.</li> <li>Remove V<sub>CC</sub> PowerManager from the Summary of Features, Power Management and Arria 10 Device Variants and packages topics. This feature is no longer supported in Arria 10 devices.</li> <li>Removed LPDDR3 from the Memory Standards Supported by the HPS Hard Memory Controller table in the Memory Standards Supported by Intel Arria 10 Devices topic. This standard is only supported by the FPGA.</li> <li>Removed transceiver speed grade 5 from the Device Variants and Packages topic for Arria 10 GX and SX devices.</li> </ul>
February 2016	2016.02.11	<ul style="list-style-type: none"> <li>Changed the maximum Arria 10 GT datarate to 25.8 Gbps and the minimum datarate to 1 Gbps globally.</li> <li>Revised the state for Core clock networks in the Summary of Features topic.</li> <li>Changed the transceiver parameters in the "Summary of Features for Arria 10 Devices" table.</li> <li>Changed the transceiver parameters in the "Maximum Resource Counts for Arria 10 GT Devices" table.</li> <li>Changed the package availability for GT devices in the "Package Plan for Arria 10 GT Devices" table.</li> <li>Changed the package configurations for GT devices in the "Migration Capability Across Arria 10 Product Lines" figure.</li> <li>Changed transceiver parameters in the "Low Power Serial Transceivers" section.</li> <li>Changed the transceiver descriptions in the "Device Variants for the Arria 10 Device Family" table.</li> <li>Changed the "Sample Ordering Code and Available Options for Arria 10 GT Devices" figure.</li> <li>Changed the datarates for GT devices in the "PMA Features" section.</li> <li>Changed the datarates for GT devices in the "PCS Features" section.</li> </ul>
