

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### **Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems**

**Embedded - System On Chip (SoC)** refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

### **What are Embedded - System On Chip (SoC)?**

**System On Chip (SoC)** integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions, SoCs combine a central

#### **Details**

Product Status	Active
Architecture	MCU, FPGA
Core Processor	Dual ARM® Cortex®-A9 MPCore™ with CoreSight™
Flash Size	-
RAM Size	256KB
Peripherals	DMA, POR, WDT
Connectivity	EBI/EMI, Ethernet, I <sup>2</sup> C, MMC/SD/SDIO, SPI, UART/USART, USB OTG
Speed	1.5GHz
Primary Attributes	FPGA - 320K Logic Elements
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FBGA, FC (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/intel/10as032h3f34i2lg">https://www.e-xfl.com/product-detail/intel/10as032h3f34i2lg</a>

## Key Advantages of Intel Arria 10 Devices

**Table 2. Key Advantages of the Intel Arria 10 Device Family**

Advantage	Supporting Feature
Enhanced core architecture	<ul style="list-style-type: none"> <li>Built on TSMC's 20 nm process technology</li> <li>60% higher performance than the previous generation of mid-range FPGAs</li> <li>15% higher performance than the fastest previous-generation FPGA</li> </ul>
High-bandwidth integrated transceivers	<ul style="list-style-type: none"> <li>Short-reach rates up to 25.8 Gigabits per second (Gbps)</li> <li>Backplane capability up to 12.5 Gbps</li> <li>Integrated 10GBASE-KR and 40GBASE-KR4 Forward Error Correction (FEC)</li> </ul>
Improved logic integration and hard IP blocks	<ul style="list-style-type: none"> <li>8-input adaptive logic module (ALM)</li> <li>Up to 65.6 megabits (Mb) of embedded memory</li> <li>Variable-precision digital signal processing (DSP) blocks</li> <li>Fractional synthesis phase-locked loops (PLLs)</li> <li>Hard PCI Express Gen3 IP blocks</li> <li>Hard memory controllers and PHY up to 2,400 Megabits per second (Mbps)</li> </ul>
Second generation hard processor system (HPS) with integrated ARM* Cortex*-A9* MPCore* processor	<ul style="list-style-type: none"> <li>Tight integration of a dual-core ARM Cortex-A9 MPCore processor, hard IP, and an FPGA in a single Intel Arria 10 system-on-a-chip (SoC)</li> <li>Supports over 128 Gbps peak bandwidth with integrated data coherency between the processor and the FPGA fabric</li> </ul>
Advanced power savings	<ul style="list-style-type: none"> <li>Comprehensive set of advanced power saving features</li> <li>Power-optimized MultiTrack routing and core architecture</li> <li>Up to 40% lower power compared to previous generation of mid-range FPGAs</li> <li>Up to 60% lower power compared to previous generation of high-end FPGAs</li> </ul>

## Summary of Intel Arria 10 Features

**Table 3. Summary of Features for Intel Arria 10 Devices**

Feature	Description
Technology	<ul style="list-style-type: none"> <li>TSMC's 20-nm SoC process technology</li> <li>Allows operation at a lower <math>V_{CC}</math> level of 0.82 V instead of the 0.9 V standard <math>V_{CC}</math> core voltage</li> </ul>
Packaging	<ul style="list-style-type: none"> <li>1.0 mm ball-pitch FINELINE BGA packaging</li> <li>0.8 mm ball-pitch Ultra FINELINE BGA packaging</li> <li>Multiple devices with identical package footprints for seamless migration between different FPGA densities</li> <li>Devices with compatible package footprints allow migration to next generation high-end Stratix® 10 devices</li> <li>RoHS, leaded<sup>(1)</sup>, and lead-free (Pb-free) options</li> </ul>
High-performance FPGA fabric	<ul style="list-style-type: none"> <li>Enhanced 8-input ALM with four registers</li> <li>Improved multi-track routing architecture to reduce congestion and improve compilation time</li> <li>Hierarchical core clocking architecture</li> <li>Fine-grained partial reconfiguration</li> </ul>
Internal memory blocks	<ul style="list-style-type: none"> <li>M20K—20-Kb memory blocks with hard error correction code (ECC)</li> <li>Memory logic array block (MLAB)—640-bit memory</li> </ul>

(1) Contact Intel for availability.

Feature	Description	
Embedded Hard IP blocks	Variable-precision DSP	<ul style="list-style-type: none"> <li>• Native support for signal processing precision levels from 18 x 19 to 54 x 54</li> <li>• Native support for 27 x 27 multiplier mode</li> <li>• 64-bit accumulator and cascade for systolic finite impulse responses (FIRs)</li> <li>• Internal coefficient memory banks</li> <li>• Preadder/subtractor for improved efficiency</li> <li>• Additional pipeline register to increase performance and reduce power</li> <li>• Supports floating point arithmetic: <ul style="list-style-type: none"> <li>– Perform multiplication, addition, subtraction, multiply-add, multiply-subtract, and complex multiplication.</li> <li>– Supports multiplication with accumulation capability, cascade summation, and cascade subtraction capability.</li> <li>– Dynamic accumulator reset control.</li> <li>– Support direct vector dot and complex multiplication chaining multiply floating point DSP blocks.</li> </ul> </li> </ul>
	Memory controller	DDR4, DDR3, and DDR3L
	PCI Express*	PCI Express (PCIe*) Gen3 (x1, x2, x4, or x8), Gen2 (x1, x2, x4, or x8) and Gen1 (x1, x2, x4, or x8) hard IP with complete protocol stack, endpoint, and root port
	Transceiver I/O	<ul style="list-style-type: none"> <li>• 10GBASE-KR/40GBASE-KR4 Forward Error Correction (FEC)</li> <li>• PCS hard IPs that support: <ul style="list-style-type: none"> <li>– 10-Gbps Ethernet (10GbE)</li> <li>– PCIe PIPE interface</li> <li>– Interlaken</li> <li>– Gbps Ethernet (GbE)</li> <li>– Common Public Radio Interface (CPRI) with deterministic latency support</li> <li>– Gigabit-capable passive optical network (GPON) with fast lock-time support</li> </ul> </li> <li>• 13.5G JESD204b</li> <li>• 8B/10B, 64B/66B, 64B/67B encoders and decoders</li> <li>• Custom mode support for proprietary protocols</li> </ul>
Core clock networks	<ul style="list-style-type: none"> <li>• Up to 800 MHz fabric clocking, depending on the application: <ul style="list-style-type: none"> <li>– 667 MHz external memory interface clocking with 2,400 Mbps DDR4 interface</li> <li>– 800 MHz LVDS interface clocking with 1,600 Mbps LVDS interface</li> </ul> </li> <li>• Global, regional, and peripheral clock networks</li> <li>• Clock networks that are not used can be gated to reduce dynamic power</li> </ul>	
Phase-locked loops (PLLs)	<ul style="list-style-type: none"> <li>• High-resolution fractional synthesis PLLs: <ul style="list-style-type: none"> <li>– Precision clock synthesis, clock delay compensation, and zero delay buffering (ZDB)</li> <li>– Support integer mode and fractional mode</li> <li>– Fractional mode support with third-order delta-sigma modulation</li> </ul> </li> <li>• Integer PLLs: <ul style="list-style-type: none"> <li>– Adjacent to general purpose I/Os</li> <li>– Support external memory and LVDS interfaces</li> </ul> </li> </ul>	
FPGA General-purpose I/Os (GPIOs)	<ul style="list-style-type: none"> <li>• 1.6 Gbps LVDS—every pair can be configured as receiver or transmitter</li> <li>• On-chip termination (OCT)</li> <li>• 1.2 V to 3.0 V single-ended LVTTTL/LVCMOS interfacing</li> </ul>	
External Memory Interface	<ul style="list-style-type: none"> <li>• Hard memory controller— DDR4, DDR3, and DDR3L support <ul style="list-style-type: none"> <li>– DDR4—speeds up to 1,200 MHz/2,400 Mbps</li> <li>– DDR3—speeds up to 1,067 MHz/2,133 Mbps</li> </ul> </li> <li>• Soft memory controller—provides support for RLD RAM 3<sup>(2)</sup>, QDR IV<sup>(2)</sup>, and QDR II+</li> </ul>	
<i>continued...</i>		

Feature	Description	
Low-power serial transceivers	<ul style="list-style-type: none"> <li>• Continuous operating range:               <ul style="list-style-type: none"> <li>— Intel Arria 10 GX—1 Gbps to 17.4 Gbps</li> <li>— Intel Arria 10 GT—1 Gbps to 25.8 Gbps</li> </ul> </li> <li>• Backplane support:               <ul style="list-style-type: none"> <li>— Intel Arria 10 GX—up to 12.5</li> <li>— Intel Arria 10 GT—up to 12.5</li> </ul> </li> <li>• Extended range down to 125 Mbps with oversampling</li> <li>• ATX transmit PLLs with user-configurable fractional synthesis capability</li> <li>• Electronic Dispersion Compensation (EDC) support for XFP, SFP+, QSFP, and CFP optical module</li> <li>• Adaptive linear and decision feedback equalization</li> <li>• Transmitter pre-emphasis and de-emphasis</li> <li>• Dynamic partial reconfiguration of individual transceiver channels</li> </ul>	
HPS (Intel Arria 10 SX devices only)	Processor and system	<ul style="list-style-type: none"> <li>• Dual-core ARM Cortex-A9 MPCore processor—1.2 GHz CPU with 1.5 GHz overdrive capability</li> <li>• 256 KB on-chip RAM and 64 KB on-chip ROM</li> <li>• System peripherals—general-purpose timers, watchdog timers, direct memory access (DMA) controller, FPGA configuration manager, and clock and reset managers</li> <li>• Security features—anti-tamper, secure boot, Advanced Encryption Standard (AES) and authentication (SHA)</li> <li>• ARM CoreSight* JTAG debug access port, trace port, and on-chip trace storage</li> </ul>
	External interfaces	<ul style="list-style-type: none"> <li>• Hard memory interface—Hard memory controller (2,400 Mbps DDR4, and 2,133 Mbps DDR3), Quad serial peripheral interface (QSPI) flash controller, NAND flash controller, direct memory access (DMA) controller, Secure Digital/MultiMediaCard (SD/MMC) controller</li> <li>• Communication interface— 10/100/1000 Ethernet media access control (MAC), USB On-The-GO (OTG) controllers, I<sup>2</sup>C controllers, UART 16550, serial peripheral interface (SPI), and up to 62 HPS GPIO interfaces (48 direct-share I/Os)</li> </ul>
	Interconnects to core	<ul style="list-style-type: none"> <li>• High-performance ARM AMBA* AXI bus bridges that support simultaneous read and write</li> <li>• HPS-FPGA bridges—include the FPGA-to-HPS, HPS-to-FPGA, and lightweight HPS-to-FPGA bridges that allow the FPGA fabric to issue transactions to slaves in the HPS, and vice versa</li> <li>• Configuration bridge that allows HPS configuration manager to configure the core logic via dedicated 32-bit configuration port</li> <li>• FPGA-to-HPS SDRAM controller bridge—provides configuration interfaces for the multiport front end (MPFE) of the HPS SDRAM controller</li> </ul>
Configuration	<ul style="list-style-type: none"> <li>• Tamper protection—comprehensive design protection to protect your valuable IP investments</li> <li>• Enhanced 256-bit advanced encryption standard (AES) design security with authentication</li> <li>• Configuration via protocol (CvP) using PCIe Gen1, Gen2, or Gen3</li> </ul>

**Related Information**

[I/O and High-Speed Differential I/O Interfaces in Intel Arria 10 Devices chapter, Intel Arria 10 Device Handbook](#)

Provides the number of 3 V and LVDS I/Os, and LVDS channels for each Intel Arria 10 device package.

## I/O Vertical Migration for Intel Arria 10 Devices

**Figure 4. Migration Capability Across Intel Arria 10 Product Lines**

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

Variant	Product Line	Package

	SX 570				↑	↑	↑	↑					
	SX 660				↓	↓	↓	↓					

*Note:* To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

## Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Figure 5. ALM for Intel Arria 10 Devices

The Intel Quartus Prime software optimizes your design according to the ALM logic structure and automatically maps legacy designs into the Intel Arria 10 ALM architecture.

## Variable-Precision DSP Block

The Intel Arria 10 variable precision DSP blocks support fixed-point arithmetic and floating-point arithmetic.

Features for fixed-point arithmetic:

- High-performance, power-optimized, and fully registered multiplication operations
- 18-bit and 27-bit word lengths
- Two 18 x 19 multipliers or one 27 x 27 multiplier per DSP block
- Built-in addition, subtraction, and 64-bit double accumulation register to combine multiplication results
- Cascading 19-bit or 27-bit when pre-adder is disabled and cascading 18-bit when pre-adder is used to form the tap-delay line for filtering applications
- Cascading 64-bit output bus to propagate output results from one block to the next block without external logic support
- Hard pre-adder supported in 19-bit and 27-bit modes for symmetric filters
- Internal coefficient register bank in both 18-bit and 27-bit modes for filter implementation
- 18-bit and 27-bit systolic finite impulse response (FIR) filters with distributed output adder
- Biased rounding support

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

**Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices**

Usage Example	Multiplier Size (Bit)	DSP Block Resources
Medium precision fixed point	Two 18 x 19	1
High precision fixed or Single precision floating point	One 27 x 27	1
Fixed point FFTs	One 19 x 36 with external adder	1
Very high precision fixed point	One 36 x 36 with external adder	2
Double precision floating point	One 54 x 54 with external adder	4

**Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices**

The table lists the variable-precision DSP resources by bit precision for each Intel Arria 10 device.

Variant	Product Line	Variable-precision DSP Block	Independent Input and Output Multiplications Operator		18 x 19 Multiplier Adder Sum Mode	18 x 18 Multiplier Adder Summed with 36 bit Input
			18 x 19 Multiplier	27 x 27 Multiplier

*continued...*

- Series ( $R_S$ ) and parallel ( $R_T$ ) on-chip termination (OCT) for all I/O banks with OCT calibration to limit the termination impedance variation
- On-chip dynamic termination that has the ability to swap between series and parallel termination, depending on whether there is read or write on a common bus for signal integrity
- Easy timing closure support using the hard read FIFO in the input register path, and delay-locked loop (DLL) delay chain with fine and coarse architecture

## External Memory Interface

Intel Arria 10 devices offer massive external memory bandwidth, with up to seven 32-bit DDR4 memory interfaces running at up to 2,400 Mbps. This bandwidth provides additional ease of design, lower power, and resource efficiencies of hardened high-performance memory controllers.

The memory interface within Intel Arria 10 FPGAs and SoCs delivers the highest performance and ease of use. You can configure up to a maximum width of 144 bits when using the hard or soft memory controllers. If required, you can bypass the hard memory controller and use a soft controller implemented in the user logic.

Each I/O contains a hardened DDR read/write path (PHY) capable of performing key memory interface functionality such as read/write leveling, FIFO buffering to lower latency and improve margin, timing calibration, and on-chip termination.

The timing calibration is aided by the inclusion of hard microcontrollers based on Intel's Nios® II technology, specifically tailored to control the calibration of multiple memory interfaces. This calibration allows the Intel Arria 10 device to compensate for any changes in process, voltage, or temperature either within the Intel Arria 10 device itself, or within the external memory device. The advanced calibration algorithms ensure maximum bandwidth and robust timing margin across all operating conditions.

In addition to parallel memory interfaces, Intel Arria 10 devices support serial memory technologies such as the Hybrid Memory Cube (HMC). The HMC is supported by the Intel Arria 10 high-speed serial transceivers which connect up to four HMC links, with each link running at data rates up to 15 Gbps.

### Related Information

#### [External Memory Interface Spec Estimator](#)

Provides a parametric tool that allows you to find and compare the performance of the supported external memory interfaces in IntelFPGAs.

## Memory Standards Supported by Intel Arria 10 Devices

The I/Os are designed to provide high performance support for existing and emerging external memory standards.

**Table 20. Memory Standards Supported by the Hard Memory Controller**

This table lists the overall capability of the hard memory controller. For specific details, refer to the External Memory Interface Spec Estimator and Intel Arria 10 Device Datasheet.

Memory Standard	Rate Support	Ping Pong PHY Support	Maximum Frequency (MHz)
DDR4 SDRAM	Quarter rate	Yes	1,067
		—	1,200
DDR3 SDRAM	Half rate	Yes	533
		—	667
	Quarter rate	Yes	1,067
		—	1,067
DDR3L SDRAM	Half rate	Yes	533
		—	667
	Quarter rate	Yes	933
		—	933
LPDDR3 SDRAM	Half rate	—	533
	Quarter rate	—	800

**Table 21. Memory Standards Supported by the Soft Memory Controller**

Memory Standard	Rate Support	Maximum Frequency (MHz)
RLDRAM 3 <sup>(11)</sup>	Quarter rate	1,200
QDR IV SRAM <sup>(11)</sup>	Quarter rate	1,067
QDR II SRAM	Full rate	333
	Half rate	633
QDR II+ SRAM	Full rate	333
	Half rate	633
QDR II+ Xtreme SRAM	Full rate	333
	Half rate	633

**Table 22. Memory Standards Supported by the HPS Hard Memory Controller**

The hard processor system (HPS) is available in Intel Arria 10 SoC devices only.

Memory Standard	Rate Support	Maximum Frequency (MHz)
DDR4 SDRAM	Half rate	1,200
DDR3 SDRAM	Half rate	1,067
DDR3L SDRAM	Half rate	933

<sup>(11)</sup> Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

### **Related Information**

#### [Intel Arria 10 Device Datasheet](#)

Lists the memory interface performance according to memory interface standards, rank or chip select configurations, and Intel Arria 10 device speed grades.

## **PCIe Gen1, Gen2, and Gen3 Hard IP**

Intel Arria 10 devices contain PCIe hard IP that is designed for performance and ease-of-use:

- Includes all layers of the PCIe stack—transaction, data link and physical layers.
- Supports PCIe Gen3, Gen2, and Gen1 Endpoint and Root Port in x1, x2, x4, or x8 lane configuration.
- Operates independently from the core logic—optional configuration via protocol (CvP) allows the PCIe link to power up and complete link training in less than 100 ms while the Intel Arria 10 device completes loading the programming file for the rest of the FPGA.
- Provides added functionality that makes it easier to support emerging features such as Single Root I/O Virtualization (SR-IOV) and optional protocol extensions.
- Provides improved end-to-end datapath protection using ECC.
- Supports FPGA configuration via protocol (CvP) using PCIe at Gen3, Gen2, or Gen1 speed.

## **Enhanced PCS Hard IP for Interlaken and 10 Gbps Ethernet**

### **Interlaken Support**

The Intel Arria 10 enhanced PCS hard IP provides integrated Interlaken PCS supporting rates up to 25.8 Gbps per lane.

The Interlaken PCS is based on the proven functionality of the PCS developed for Intel's previous generation FPGAs, which demonstrated interoperability with Interlaken ASSP vendors and third-party IP suppliers. The Interlaken PCS is present in every transceiver channel in Intel Arria 10 devices.

### **Related Information**

[PCS Features](#) on page 30

### **10 Gbps Ethernet Support**

The Intel Arria 10 enhanced PCS hard IP supports 10GBASE-R PCS compliant with IEEE 802.3 10 Gbps Ethernet (10GbE). The integrated hard IP support for 10GbE and the 10 Gbps transceivers save external PHY cost, board space, and system power.

Figure 6. Intel Arria 10 Transceiver Block Architecture

## Transceiver Channels

All transceiver channels feature a dedicated Physical Medium Attachment (PMA) and a hardened Physical Coding Sublayer (PCS).

- The PMA provides primary interfacing capabilities to physical channels.
- The PCS typically handles encoding/decoding, word alignment, and other pre-processing functions before transferring data to the FPGA core fabric.

A transceiver channel consists of a PMA and a PCS block. Most transceiver banks have 6 channels. There are some transceiver banks that contain only 3 channels.

A wide variety of bonded and non-bonded data rate configurations is possible using a highly configurable clock distribution network. Up to 80 independent transceiver data rates can be configured.

The following figures are graphical representations of top views of the silicon die, which correspond to reverse views for flip chip packages. Different Intel Arria 10 devices may have different floorplans than the ones shown in the figures.

Figure 7. Device Chip Overview for Intel Arria 10 GX and GT Devices

Figure 8. Device Chip Overview for Intel Arria 10 SX Devices

### PMA Features

Intel Arria 10 transceivers provide exceptional signal integrity at data rates up to 25.8 Gbps. Clocking options include ultra-low jitter ATX PLLs (LC tank based), clock multiplier unit (CMU) PLLs, and fractional PLLs.

PCS	Description
Standard PCS	<ul style="list-style-type: none"> <li>Operates at a data rate up to 12 Gbps</li> <li>Supports protocols such as PCI-Express, CPRI 4.2+, GigE, IEEE 1588 in Hard PCS</li> <li>Implements other protocols using Basic/Custom (Standard PCS) transceiver configuration rules.</li> </ul>
Enhanced PCS	<ul style="list-style-type: none"> <li>Performs functions common to most serial data industry standards, such as word alignment, encoding/decoding, and framing, before data is sent or received off-chip through the PMA</li> <li>Handles data transfer to and from the FPGA fabric</li> <li>Handles data transfer internally to and from the PMA</li> <li>Provides frequency compensation</li> <li>Performs channel bonding for multi-channel low skew applications</li> </ul>
PCIe Gen3 PCS	<ul style="list-style-type: none"> <li>Supports the seamless switching of Data and Clock between the Gen1, Gen2, and Gen3 data rates</li> <li>Provides support for PIPE 3.0 features</li> <li>Supports the PIPE interface with the Hard IP enabled, as well as with the Hard IP bypassed</li> </ul>

**Figure 9. HPS Block Diagram**

This figure shows a block diagram of the HPS with the dual ARM Cortex-A9 MPCore processor.

**Key Advantages of 20-nm HPS**

The 20-nm HPS strikes a balance between enabling maximum software compatibility with 28-nm SoCs while still improving upon the 28-nm HPS architecture. These improvements address the requirements of the next generation target markets such as wireless and wireline communications, compute and storage equipment, broadcast and military in terms of performance, memory bandwidth, connectivity via backplane and security.

**Table 24. Improvements in 20 nm HPS**

This table lists the key improvements of the 20 nm HPS compared to the 28 nm HPS.

Advantages/ Improvements	Description
Increased performance and overdrive capability	While the nominal processor frequency is 1.2 GHz, the 20 nm HPS offers an “overdrive” feature which enables a higher processor operating frequency. This requires a higher supply voltage value that is unique to the HPS and may require a separate regulator.
Increased processor memory bandwidth and DDR4 support	Up to 64-bit DDR4 memory at 2,400 Mbps support is available for the processor. The hard memory controller for the HPS comprises a multi-port front end that manages connections to a single port memory controller. The multi-port front end allows logic core and the HPS to share ports and thereby the available bandwidth of the memory controller.
Flexible I/O sharing	<p>An advanced I/O pin muxing scheme allows improved sharing of I/O between the HPS and the core logic. The following types of I/O are available for SoC:</p> <ul style="list-style-type: none"> <li>• 17 dedicated I/Os—physically located inside the HPS block and are not accessible to logic within the core. The 17 dedicated I/Os are used for HPS clock, resets, and interfacing with boot devices, QSPI, and SD/MMC.</li> <li>• 48 direct shared I/O—located closest to the HPS block and are ideal for high speed HPS peripherals such as EMAC, USB, and others. There is one bank of 48 I/Os that supports direct sharing where the 48 I/Os can be shared 12 I/Os at a time.</li> <li>• Standard (shared) I/O—all standard I/Os can be shared by the HPS peripherals and any logic within the core. For designs where more than 48 I/Os are required to fully use all the peripherals in the HPS, these I/Os can be connected through the core logic.</li> </ul>
EMAC core	Three EMAC cores are available in the HPS. The EMAC cores enable an application to support two redundant Ethernet connections; for example, backplane, or two EMAC cores for managing IEEE 1588 time stamp information while allowing a third EMAC core for debug and configuration. All three EMACs can potentially share the same time stamps, simplifying the 1588 time stamping implementation. A new serial time stamp interface allows core logic to access and read the time stamp values. The integrated EMAC controllers can be connected to external Ethernet PHY through the provided MDIO or I <sup>2</sup> C interface.
On-chip memory	The on-chip memory is updated to 256 KB support and can support larger data sets and real time algorithms.
ECC enhancements	Improvements in L2 Cache ECC management allow identification of errors down to the address level. ECC enhancements also enable improved error injection and status reporting via the introduction of new memory mapped access to syndrome and data signals.
HPS to FPGA Interconnect Backbone	Although the HPS and the Logic Core can operate independently, they are tightly coupled via a high-bandwidth system interconnect built from high-performance ARM AMBA AXI bus bridges. IP bus masters in the FPGA fabric have access to HPS bus slaves via the FPGA-to-HPS interconnect. Similarly, HPS bus masters have access to bus slaves in the core fabric via the HPS-to-FPGA bridge. Both bridges are AMBA AXI-3 compliant and support simultaneous read and write transactions. Up to three masters within the core fabric can share the HPS SDRAM controller with the processor. Additionally, the processor can be used to configure the core fabric under program control via a dedicated 32-bit configuration port.
FPGA configuration and HPS booting	<p>The FPGA fabric and HPS in the SoCs are powered independently. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.</p> <p>You can configure the FPGA fabric and boot the HPS independently, in any order, providing you with more design flexibility.</p>
Security	New security features have been introduced for anti-tamper management, secure boot, encryption (AES), and authentication (SHA).

## Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
  - ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit Thumb instructions, and 8-bit Java byte codes in Jazelle style
  - Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
  - Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
  - 32 KB of L1 instruction cache, 32 KB of L1 data cache
  - Single- and double-precision floating-point unit and NEON media engine
  - CoreSight debug and trace technology
  - Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I<sup>2</sup>C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)
