### **Embedded - System On Chip (SoC): The Heart of Modern Embedded Systems**

**Embedded - System On Chip (SoC)** refers to an integrated circuit that consolidates all the essential components of a computer system into a single chip. This includes a microprocessor, memory, and other peripherals, all packed into one compact and efficient package. SoCs are designed to provide a complete computing solution, optimizing both space and power consumption, making them ideal for a wide range of embedded applications.

### **What are Embedded - System On Chip (SoC)?**

**System On Chip (SoC)** integrates multiple functions of a computer or electronic system onto a single chip. Unlike traditional multi-chip solutions. SoCs combine a central

#### **Details**

|                         |   |
|-------------------------|---|
| Product Status          | Active  |
| Architecture            | MCU, FPGA   |
| Core Processor          | Dual ARM® Cortex®-A9 MPCore™ with CoreSight™  |
| Flash Size              | -   |
| RAM Size                | 256KB   |
| Peripherals             | DMA, POR, WDT   |
| Connectivity            | EBI/EMI, Ethernet, I <sup>2</sup> C, MMC/SD/SDIO, SPI, UART/USART, USB OTG  |
| Speed                   | 1.5GHz  |
| Primary Attributes      | FPGA - 570K Logic Elements  |
| Operating Temperature   | 0°C ~ 100°C (TJ)  |
| Package / Case          | 1152-BBGA, FCBGA  |

## Intel® Arria® 10 Device Overview

The Intel® Arria® 10 device family consists of high-performance and power-efficient 20 nm mid-range FPGAs and SoCs.

Intel Arria 10 device family delivers:

- Higher performance than the previous generation of mid-range and high-end FPGAs.
- Power efficiency attained through a comprehensive set of power-saving technologies.

The Intel Arria 10 devices are ideal for high performance, power-sensitive, midrange applications in diverse markets.

**Table 1. Sample Markets and Ideal Applications for Intel Arria 10 Devices**

| Market                | Applications  |
|-----------------------|---|
| Wireless              | <ul style="list-style-type: none"> <li>• Channel and switch cards in remote radio heads</li> <li>• Mobile backhaul</li> </ul>   |
| Wireline              | <ul style="list-style-type: none"> <li>• 40G/100G muxponders and transponders</li> <li>• 100G line cards</li> <li>• Bridging</li> <li>• Aggregation</li> </ul>            |
| Broadcast             | <ul style="list-style-type: none"> <li>• Studio switches</li> <li>• Servers and transport</li> <li>• Videoconferencing</li> <li>• Professional audio and video</li> </ul> |
| Computing and Storage | <ul style="list-style-type: none"> <li>• Flash cache</li> <li>• Cloud computing servers</li> <li>• Server acceleration</li> </ul>   |
| Medical               | <ul style="list-style-type: none"> <li>• Diagnostic scanners</li> <li>• Diagnostic imaging</li> </ul>   |
| Military              | <ul style="list-style-type: none"> <li>• Missile guidance and control</li> <li>• Radar</li> <li>• Electronic warfare</li> <li>• Secure communications</li> </ul>          |

| SX 270       | —  | —           | —    | 48                                      | 192         | 12   | 48                                      | 312         | 12   | 48                                       | 336         | 24   |
| SX 320       | —  | —           | —    | 48                                      | 192         | 12   | 48                                      | 312         | 12   | 48                                       | 336         | 24   |
| continued... |  |             |      |   |             |      |   |             |      |  |             |      |

<sup>(8)</sup> The number of GPIOs does not include transceiver I/Os. In the Intel Quartus Prime software, the number of user I/Os includes transceiver I/Os.

<sup>(9)</sup> Each LVDS I/O pair can be used as differential input or output.

## I/O Vertical Migration for Intel Arria 10 Devices

**Figure 4. Migration Capability Across Intel Arria 10 Product Lines**

- The arrows indicate the migration paths. The devices included in each vertical migration path are shaded. Devices with fewer resources in the same path have lighter shades.
- To achieve the full I/O migration across product lines in the same migration path, restrict I/Os and transceivers usage to match the product line with the lowest I/O and transceiver counts.
- An LVDS I/O bank in the source device may be mapped to a 3 V I/O bank in the target device. To use memory interface clock frequency higher than 533 MHz, assign external memory interface pins only to banks that are LVDS I/O in both devices.
- There may be nominal 0.15 mm package height difference between some product lines in the same package type.
- Some migration paths are not shown in the Intel Quartus Prime software **Pin Migration View**.

| Variant             | Product Line | Package |     |     |     |     |      |      |      |      |      |      |
|---------------------|--------------|---------|-----|-----|-----|-----|------|------|------|------|------|------|
|                     |              | U19     | F27 | F29 | F34 | F35 | KF40 | NF40 | RF40 | NF45 | SF45 | UF45 |

**Note:** To verify the pin migration compatibility, use the **Pin Migration View** window in the Intel Quartus Prime software Pin Planner.

## Adaptive Logic Module

Intel Arria 10 devices use a 20 nm ALM as the basic building block of the logic fabric.

The ALM architecture is the same as the previous generation FPGAs, allowing for efficient implementation of logic functions and easy conversion of IP between the device generations.

The ALM, as shown in following figure, uses an 8-input fracturable look-up table (LUT) with four dedicated registers to help improve timing closure in register-rich designs and achieve an even higher design packing capability than the traditional two-register per LUT architecture.

Features for floating-point arithmetic:

- A completely hardened architecture that supports multiplication, addition, subtraction, multiply-add, and multiply-subtract
- Multiplication with accumulation capability and a dynamic accumulator reset control
- Multiplication with cascade summation capability
- Multiplication with cascade subtraction capability
- Complex multiplication
- Direct vector dot product
- Systolic FIR filter

**Table 15. Variable-Precision DSP Block Configurations for Intel Arria 10 Devices**

| Usage Example   | Multiplier Size (Bit)           | DSP Block Resources |
|---|---------------------------------|---------------------|
| Medium precision fixed point                            | Two 18 x 19                     | 1                   |
| High precision fixed or Single precision floating point | One 27 x 27                     | 1                   |
| Fixed point FFTs  | One 19 x 36 with external adder | 1                   |
| Very high precision fixed point                         | One 36 x 36 with external adder | 2                   |
| Double precision floating point                         | One 54 x 54 with external adder | 4                   |

**Table 16. Resources for Fixed-Point Arithmetic in Intel Arria 10 Devices**

The table lists the variable-precision DSP resources by bit precision for each Intel Arria 10 device.

| Variant           | Product Line | Variable-precision DSP Block | Independent Input and Output Multiplications Operator |                    | 18 x 19 Multiplier Adder Sum Mode | 18 x 18 Multiplier Adder Summed with 36 bit Input |
|-------------------|--------------|------------------------------|---|--------------------|-----------------------------------|---|
|                   |              |                              | 18 x 19 Multiplier                                    | 27 x 27 Multiplier |                                   |   |
| Intel Arria 10 GX | GX 160       | 156                          | 312   | 156                | 156                               | 156   |
|                   | GX 220       | 192                          | 384   | 192                | 192                               | 192   |
|                   | GX 270       | 830                          | 1,660   | 830                | 830                               | 830   |
|                   | GX 320       | 984                          | 1,968   | 984                | 984                               | 984   |
|                   | GX 480       | 1,368                        | 2,736   | 1,368              | 1,368                             | 1,368   |
|                   | GX 570       | 1,523                        | 3,046   | 1,523              | 1,523                             | 1,523   |
|                   | GX 660       | 1,687                        | 3,374   | 1,687              | 1,687                             | 1,687   |
|                   | GX 900       | 1,518                        | 3,036   | 1,518              | 1,518                             | 1,518   |
|                   | GX 1150      | 1,518                        | 3,036   | 1,518              | 1,518                             | 1,518   |
| Intel Arria 10 GT | GT 900       | 1,518                        | 3,036   | 1,518              | 1,518                             | 1,518   |
|                   | GT 1150      | 1,518                        | 3,036   | 1,518              | 1,518                             | 1,518   |
| Intel Arria 10 SX | SX 160       | 156                          | 312   | 156                | 156                               | 156   |

*continued...*

The fractional synthesis PLLs support the following features:

- Reference clock frequency synthesis for transceiver CMU and Advanced Transmit (ATX) PLLs
- Clock network delay compensation
- Zero-delay buffering
- Direct transmit clocking for transceivers
- Independently configurable into two modes:
  - Conventional integer mode equivalent to the general purpose PLL
  - Enhanced fractional mode with third order delta-sigma modulation
- PLL cascading

## I/O PLLs

The integer mode I/O PLLs are located in each bank of 48 I/Os. You can use the I/O PLLs to simplify the design of external memory and high-speed LVDS interfaces.

In each I/O bank, the I/O PLLs are adjacent to the hard memory controllers and LVDS SERDES. Because these PLLs are tightly coupled with the I/Os that need to use them, it makes it easier to close timing.

You can use the I/O PLLs for general purpose applications in the core such as clock network delay compensation and zero-delay buffering.

Intel Arria 10 devices support PLL-to-PLL cascading.

## FPGA General Purpose I/O

Intel Arria 10 devices offer highly configurable GPIOs. Each I/O bank contains 48 general purpose I/Os and a high-efficiency hard memory controller.

The following list describes the features of the GPIOs:

- Consist of 3 V I/Os for high-voltage application and LVDS I/Os for differential signaling
  - Up to two 3 V I/O banks, available in some devices, that support up to 3 V I/O standards
  - LVDS I/O banks that support up to 1.8 V I/O standards
- Support a wide range of single-ended and differential I/O interfaces
- LVDS speeds up to 1.6 Gbps
- Each LVDS pair of pins has differential input and output buffers, allowing you to configure the LVDS direction for each pair.
- Programmable bus hold and weak pull-up
- Programmable differential output voltage ( $V_{OD}$ ) and programmable pre-emphasis

**Table 20. Memory Standards Supported by the Hard Memory Controller**

This table lists the overall capability of the hard memory controller. For specific details, refer to the External Memory Interface Spec Estimator and Intel Arria 10 Device Datasheet.

| Memory Standard | Rate Support | Ping Pong PHY Support | Maximum Frequency (MHz) |
|-----------------|--------------|-----------------------|-------------------------|
| DDR4 SDRAM      | Quarter rate | Yes                   | 1,067                   |
|                 |              | —                     | 1,200                   |
| DDR3 SDRAM      | Half rate    | Yes                   | 533                     |
|                 |              | —                     | 667                     |
|                 | Quarter rate | Yes                   | 1,067                   |
|                 |              | —                     | 1,067                   |
| DDR3L SDRAM     | Half rate    | Yes                   | 533                     |
|                 |              | —                     | 667                     |
|                 | Quarter rate | Yes                   | 933                     |
|                 |              | —                     | 933                     |
| LPDDR3 SDRAM    | Half rate    | —                     | 533                     |
|                 | Quarter rate | —                     | 800                     |

**Table 21. Memory Standards Supported by the Soft Memory Controller**

| Memory Standard             | Rate Support | Maximum Frequency (MHz) |
|-----------------------------|--------------|-------------------------|
| RLDRAM 3 <sup>(11)</sup>    | Quarter rate | 1,200                   |
| QDR IV SRAM <sup>(11)</sup> | Quarter rate | 1,067                   |
| QDR II SRAM                 | Full rate    | 333                     |
|                             | Half rate    | 633                     |
| QDR II+ SRAM                | Full rate    | 333                     |
|                             | Half rate    | 633                     |
| QDR II+ Xtreme SRAM         | Full rate    | 333                     |
|                             | Half rate    | 633                     |

**Table 22. Memory Standards Supported by the HPS Hard Memory Controller**

The hard processor system (HPS) is available in Intel Arria 10 SoC devices only.

| Memory Standard | Rate Support | Maximum Frequency (MHz) |
|-----------------|--------------|-------------------------|
| DDR4 SDRAM      | Half rate    | 1,200                   |
| DDR3 SDRAM      | Half rate    | 1,067                   |
| DDR3L SDRAM     | Half rate    | 933                     |

<sup>(11)</sup> Intel Arria 10 devices support this external memory interface using hard PHY with soft memory controller.

Each transceiver channel contains a channel PLL that can be used as the CMU PLL or clock data recovery (CDR) PLL. In CDR mode, the channel PLL recovers the receiver clock and data in the transceiver channel. Up to 80 independent data rates can be configured on a single Intel Arria 10 device.

**Table 23. PMA Features of the Transceivers in Intel Arria 10 Devices**

| Feature   | Capability   |
|---|--|
| Chip-to-Chip Data Rates                                 | 1 Gbps to 17.4 Gbps (Intel Arria 10 GX devices)<br>1 Gbps to 25.8 Gbps (Intel Arria 10 GT devices)   |
| Backplane Support                                       | Drive backplanes at data rates up to 12.5 Gbps   |
| Optical Module Support                                  | SFP+/SFP, XFP, CXP, QSFP/QSFP28, CFP/CFP2/CFP4   |
| Cable Driving Support                                   | SFP+ Direct Attach, PCI Express over cable, eSATA  |
| Transmit Pre-Emphasis                                   | 4-tap transmit pre-emphasis and de-emphasis to compensate for system channel loss  |
| Continuous Time Linear Equalizer (CTLE)                 | Dual mode, high-gain, and high-data rate, linear receive equalization to compensate for system channel loss  |
| Decision Feedback Equalizer (DFE)                       | 7-fixed and 4-floating tap DFE to equalize backplane channel loss in the presence of crosstalk and noisy environments  |
| Variable Gain Amplifier                                 | Optimizes the signal amplitude prior to the CDR sampling and operates in fixed and adaptive modes  |
| Altera Digital Adaptive Parametric Tuning (ADAPT)       | Fully digital adaptation engine to automatically adjust all link equalization parameters—including CTLE, DFE, and variable gain amplifier blocks—that provide optimal link margin without intervention from user logic |
| Precision Signal Integrity Calibration Engine (PreSICE) | Hardened calibration controller to quickly calibrate all transceiver control parameters on power-up, which provides the optimal signal integrity and jitter performance  |
| Advanced Transmit (ATX) PLL                             | Low jitter ATX (LC tank based) PLLs with continuous tuning range to cover a wide range of standard and proprietary protocols   |
| Fractional PLLs   | On-chip fractional frequency synthesizers to replace on-board crystal oscillators and reduce system cost   |
| Digitally Assisted Analog CDR                           | Superior jitter tolerance with fast lock time  |
| Dynamic Partial Reconfiguration                         | Allows independent control of the Avalon memory-mapped interface of each transceiver channel for the highest transceiver flexibility   |
| Multiple PCS-PMA and PCS-PLD interface widths           | 8-, 10-, 16-, 20-, 32-, 40-, or 64-bit interface widths for flexibility of deserialization width, encoding, and reduced latency  |

## PCS Features

This table summarizes the Intel Arria 10 transceiver PCS features. You can use the transceiver PCS to support a wide range of protocols ranging from 1 Gbps to 25.8 Gbps.

| Protocol             | Data Rate (Gbps)              | Transceiver IP | PCS Support  |
|----------------------|-------------------------------|----------------|--------------|
| CPRI 6.0 (64B/66B)   | 0.6144 to 10.1376             | Native PHY     | Enhanced PCS |
| CPRI 4.2 (8B/10B)    | 0.6144 to 9.8304              | Native PHY     | Standard PCS |
| OBSAI RP3 v4.2       | 0.6144 to 6.144               | Native PHY     | Standard PCS |
| SD-SDI/HD-SDI/3G-SDI | 0.143 <sup>(12)</sup> to 2.97 | Native PHY     | Standard PCS |

## SoC with Hard Processor System

Each SoC device combines an FPGA fabric and a hard processor system (HPS) in a single device. This combination delivers the flexibility of programmable logic with the power and cost savings of hard IP in these ways:

- Reduces board space, system power, and bill of materials cost by eliminating a discrete embedded processor
- Allows you to differentiate the end product in both hardware and software, and to support virtually any interface standard
- Extends the product life and revenue through in-field hardware and software updates

---

<sup>(12)</sup> The 0.143 Gbps data rate is supported using oversampling of user logic that you must implement in the FPGA fabric.

## Features of the HPS

The HPS has the following features:

- 1.2-GHz, dual-core ARM Cortex-A9 MPCore processor with up to 1.5-GHz via overdrive
  - ARMv7-A architecture that runs 32-bit ARM instructions, 16-bit and 32-bit Thumb instructions, and 8-bit Java byte codes in Jazelle style
  - Superscalar, variable length, out-of-order pipeline with dynamic branch prediction
  - Instruction Efficiency 2.5 MIPS/MHz, which provides total performance of 7500 MIPS at 1.5 GHz
- Each processor core includes:
  - 32 KB of L1 instruction cache, 32 KB of L1 data cache
  - Single- and double-precision floating-point unit and NEON media engine
  - CoreSight debug and trace technology
  - Snoop Control Unit (SCU) and Acceleration Coherency Port (ACP)
- 512 KB of shared L2 cache
- 256 KB of scratch RAM
- Hard memory controller with support for DDR3, DDR4 and optional error correction code (ECC) support
- Multiport Front End (MPFE) Scheduler interface to the hard memory controller
- 8-channel direct memory access (DMA) controller
- QSPI flash controller with SIO, DIO, QIO SPI Flash support
- NAND flash controller (ONFI 1.0 or later) with DMA and ECC support, updated to support 8 and 16-bit Flash devices and new command DMA to offload CPU for fast power down recovery
- Updated SD/SDIO/MMC controller to eMMC 4.5 with DMA with CE-ATA digital command support
- 3 10/100/1000 Ethernet media access control (MAC) with DMA
- 2 USB On-the-Go (OTG) controllers with DMA
- 5 I<sup>2</sup>C controllers (3 can be used by EMAC for MIO to external PHY)
- 2 UART 16550 Compatible controllers
- 4 serial peripheral interfaces (SPI) (2 Master, 2 Slaves)
- 62 programmable general-purpose I/Os, which includes 48 direct share I/Os that allows the HPS peripherals to connect directly to the FPGA I/Os
- 7 general-purpose timers
- 4 watchdog timers
- Anti-tamper, Secure Boot, Encryption (AES) and Authentication (SHA)

## FPGA Configuration and HPS Booting

The FPGA fabric and HPS in the SoC FPGA must be powered at the same time. You can reduce the clock frequencies or gate the clocks to reduce dynamic power.

Once powered, the FPGA fabric and HPS can be configured independently thus providing you with more design flexibility:

- You can boot the HPS independently. After the HPS is running, the HPS can fully or partially reconfigure the FPGA fabric at any time under software control. The HPS can also configure other FPGAs on the board through the FPGA configuration controller.
- Configure the FPGA fabric first, and then boot the HPS from memory accessible to the FPGA fabric.

## Hardware and Software Development

For hardware development, you can configure the HPS and connect your soft logic in the FPGA fabric to the HPS interfaces using the Platform Designer system integration tool in the Intel Quartus Prime software.

For software development, the ARM-based SoC FPGA devices inherit the rich software development ecosystem available for the ARM Cortex-A9 MPCore processor. The software development process for Intel SoC FPGAs follows the same steps as those for other SoC devices from other manufacturers. Support for Linux\*, VxWorks\*, and other operating systems are available for the SoC FPGAs. For more information on the operating systems support availability, contact the Intel FPGA sales team.

You can begin device-specific firmware and software development on the Intel SoC FPGA Virtual Target. The Virtual Target is a fast PC-based functional simulation of a target development system—a model of a complete development board. The Virtual Target enables the development of device-specific production software that can run unmodified on actual hardware.

## Dynamic and Partial Reconfiguration

The Intel Arria 10 devices support dynamic and partial reconfiguration. You can use dynamic and partial reconfiguration simultaneously to enable seamless reconfiguration of both the device core and transceivers.

### Dynamic Reconfiguration

You can reconfigure the PMA and PCS blocks while the device continues to operate. This feature allows you to change the data rates, protocol, and analog settings of a channel in a transceiver bank without affecting on-going data transfer in other transceiver banks. This feature is ideal for applications that require dynamic multiprotocol or multirate support.

### Partial Reconfiguration

Using partial reconfiguration, you can reconfigure some parts of the device while keeping the device in operation.

Instead of placing all device functions in the FPGA fabric, you can store some functions that do not run simultaneously in external memory and load them only when required. This capability increases the effective logic density of the device, and lowers cost and power consumption.

In the Intel solution, you do not have to worry about intricate device architecture to perform a partial reconfiguration. The partial reconfiguration capability is built into the Intel Quartus Prime design software, making such time-intensive task simple.

Intel Arria 10 devices support partial reconfiguration in the following configuration options:

- Using an internal host:
  - All supported configuration modes where the FPGA has access to external memory devices such as serial and parallel flash memory.
  - Configuration via Protocol [CvP (PCIe)]
- Using an external host—passive serial (PS), fast passive parallel (FPP) x8, FPP x16, and FPP x32 I/O interface.

## Enhanced Configuration and Configuration via Protocol

**Table 25. Configuration Schemes and Features of Intel Arria 10 Devices**

Intel Arria 10 devices support 1.8 V programming voltage and several configuration schemes.

| Scheme   | Data Width    | Max Clock Rate (MHz) | Max Data Rate (Mbps) <sup>(13)</sup> | Decompression | Design Security <sup>(14)</sup> | Partial Reconfiguration <sup>(15)</sup> | Remote System Update                |
|--|---------------|----------------------|--------------------------------------|---------------|---------------------------------|---|-------------------------------------|
| JTAG   | 1 bit         | 33                   | 33                                   | —             | —                               | Yes <sup>(16)</sup>                     | —                                   |
| Active Serial (AS) through the EPCQ-L configuration device   | 1 bit, 4 bits | 100                  | 400                                  | Yes           | Yes                             | Yes <sup>(16)</sup>                     | Yes                                 |
| Passive serial (PS) through CPLD or external microcontroller | 1 bit         | 100                  | 100                                  | Yes           | Yes                             | Yes <sup>(16)</sup>                     | Parallel Flash Loader (PFL) IP core |

*continued...*

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(16)</sup> Partial configuration can be performed only when it is configured as internal host.

| Scheme   | Data Width           | Max Clock Rate (MHz) | Max Data Rate (Mbps) <sup>(13)</sup> | Decompression | Design Security <sup>(14)</sup> | Partial Reconfiguration <sup>(15)</sup> | Remote System Update |
|--|----------------------|----------------------|--------------------------------------|---------------|---------------------------------|---|----------------------|
| Fast passive parallel (FPP) through CPLD or external microcontroller | 8 bits               | 100                  | 3200                                 | Yes           | Yes                             | Yes <sup>(17)</sup>                     | PFL IP core          |
|  | 16 bits              |                      |                                      | Yes           | Yes                             |   |                      |
|  | 32 bits              |                      |                                      | Yes           | Yes                             |   |                      |
| Configuration via HPS  | 16 bits              | 100                  | 3200                                 | Yes           | Yes                             | Yes <sup>(17)</sup>                     | —                    |
|  | 32 bits              |                      |                                      | Yes           | Yes                             |   |                      |
| Configuration via Protocol [CvP (PCIe*)]                             | x1, x2, x4, x8 lanes | —                    | 8000                                 | Yes           | Yes                             | Yes <sup>(16)</sup>                     | —                    |

You can configure Intel Arria 10 devices through PCIe using Configuration via Protocol (CvP). The Intel Arria 10 CvP implementation conforms to the PCIe 100 ms power-up-to-active time requirement.

## SEU Error Detection and Correction

Intel Arria 10 devices offer robust and easy-to-use single-event upset (SEU) error detection and correction circuitry.

The detection and correction circuitry includes protection for Configuration RAM (CRAM) programming bits and user memories. The CRAM is protected by a continuously running CRC error detection circuit with integrated ECC that automatically corrects one or two errors and detects higher order multi-bit errors. When more than two errors occur, correction is available through reloading of the core programming file, providing a complete design refresh while the FPGA continues to operate.

The physical layout of the Intel Arria 10 CRAM array is optimized to make the majority of multi-bit upsets appear as independent single-bit or double-bit errors which are automatically corrected by the integrated CRAM ECC circuitry. In addition to the CRAM protection, the M20K memory blocks also include integrated ECC circuitry and are layout-optimized for error detection and correction. The MLAB does not have ECC.

## Power Management

Intel Arria 10 devices leverage the advanced 20 nm process technology, a low 0.9 V core power supply, an enhanced core architecture, and several optional power reduction techniques to reduce total power consumption by as much as 40% compared to Arria V devices and as much as 60% compared to Stratix V devices.

<sup>(13)</sup> Enabling either compression or design security features affects the maximum data rate. Refer to the Intel Arria 10 Device Datasheet for more information.

<sup>(14)</sup> Encryption and compression cannot be used simultaneously.

<sup>(15)</sup> Partial reconfiguration is an advanced feature of the device family. If you are interested in using partial reconfiguration, contact Intel for support.

<sup>(17)</sup> Supported at a maximum clock rate of 100 MHz.

The optional power reduction techniques in Intel Arria 10 devices include:

- **SmartVID**—a code is programmed into each device during manufacturing that allows a smart regulator to operate the device at lower core  $V_{CC}$  while maintaining performance
- **Programmable Power Technology**—non-critical timing paths are identified by the Intel Quartus Prime software and the logic in these paths is biased for low power instead of high performance
- **Low Static Power Options**—devices are available with either standard static power or low static power while maintaining performance

Furthermore, Intel Arria 10 devices feature Intel's industry-leading low power transceivers and include a number of hard IP blocks that not only reduce logic resources but also deliver substantial power savings compared to soft implementations. In general, hard IP blocks consume up to 90% less power than the equivalent soft logic implementations.

## Incremental Compilation

The Intel Quartus Prime software incremental compilation feature reduces compilation time and helps preserve performance to ease timing closure. The incremental compilation feature enables the partial reconfiguration flow for Intel Arria 10 devices.

Incremental compilation supports top-down, bottom-up, and team-based design flows. This feature facilitates modular, hierarchical, and team-based design flows where different designers compile their respective design sections in parallel. Furthermore, different designers or IP providers can develop and optimize different blocks of the design independently. These blocks can then be imported into the top level project.

## Document Revision History for Intel Arria 10 Device Overview

| Document Version | Changes  |
|------------------|--|
| 2018.04.09       | Updated the lowest $V_{CC}$ from 0.83 V to 0.82 V in the topic listing a summary of the device features. |

| Date           | Version    | Changes  |
|----------------|------------|--|
| December 2015  | 2015.12.14 | <ul style="list-style-type: none"> <li>Updated the number of M20K memory blocks for Arria 10 GX 660 from 2133 to 2131 and corrected the total RAM bit from 48,448 Kb to 48,408 Kb.</li> <li>Corrected the number of DSP blocks for Arria 10 GX 660 from 1688 to 1687 in the table listing floating-point arithmetic resources.</li> </ul>  |
| November 2015  | 2015.11.02 | <ul style="list-style-type: none"> <li>Updated the maximum resources for Arria 10 GX 220, GX 320, GX 480, GX 660, SX 220, SX 320, SX 480, and SX 660.</li> <li>Updated resource count for Arria 10 GX 320, GX 480, GX 660, SX 320, SX 480, a SX 660 devices in <b>Number of Multipliers in Intel Arria 10 Devices</b> table.</li> <li>Updated the available options for Arria 10 GX, GT, and SX.</li> <li>Changed instances of <i>Quartus II</i> to <i>Quartus Prime</i>.</li> </ul>   |
| June 2015      | 2015.06.15 | Corrected label for Intel Arria 10 GT product lines in the vertical migration figure.  |
| May 2015       | 2015.05.15 | Corrected the DDR3 half rate and quarter rate maximum frequencies in the table that lists the memory standards supported by the Intel Arria 10 hard memory controller.   |
| May 2015       | 2015.05.04 | <ul style="list-style-type: none"> <li>Added support for 13.5G JESD204b in the Summary of Features table.</li> <li>Added a link to Arria 10 GT Channel Usage in the Arria 10 GT Package Plan topic.</li> <li>Added a note to the table, Maximum Resource Counts for Arria 10 GT devices.</li> <li>Updated the power requirements of the transceivers in the Low Power Serial Transceivers topic.</li> </ul>  |
| January 2015   | 2015.01.23 | <ul style="list-style-type: none"> <li>Added floating point arithmetic features in the Summary of Features table.</li> <li>Updated the total embedded memory from 38.38 megabits (Mb) to 65.6 Mb.</li> <li>Updated the table that lists the memory standards supported by Intel Arria 10 devices.</li> <li>Removed support for DDR3U, LPDDR3 SDRAM, RLDRAM 2, and DDR2.</li> <li>Moved RLDRAM 3 support from hard memory controller to soft memory controller. RLDRAM 3 support uses hard PHY with soft memory controller.</li> <li>Added soft memory controller support for QDR IV.</li> <li>Updated the maximum resource count table to include the number of hard memory controllers available in each device variant.</li> <li>Updated the transceiver PCS data rate from 12.5 Gbps to 12 Gbps.</li> <li>Updated the max clock rate of PS, FPP x8, FPP x16, and Configuration via HPS from 125 MHz to 100 MHz.</li> <li>Added a feature for fractional synthesis PLLs: PLL cascading.</li> <li>Updated the HPS programmable general-purpose I/Os from 54 to 62.</li> </ul> |
| September 2014 | 2014.09.30 | <ul style="list-style-type: none"> <li>Corrected the 3 V I/O and LVDS I/O counts for F35 and F36 packages of Arria 10 GX.</li> <li>Corrected the 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 570 and 660.</li> <li>Removed 3 V I/O, LVDS I/O, and transceiver counts for the NF40 package of the Arria GX 900 and 1150. The NF40 package is not available for Arria 10 GX 900 and 1150.</li> </ul>  |

| Date          | Version    | Changes  |
|---------------|------------|--|
| August 2014   | 2014.08.18 | <ul style="list-style-type: none"> <li>Updated Memory (Kb) M20K maximum resources for Arria 10 GX 660 devices from 42,660 to 42,620.</li> <li>Added GPIO columns consisting of LVDS I/O Bank and 3V I/O Bank in the Package Plan table.</li> <li>Added how to use memory interface clock frequency higher than 533 MHz in the I/O vertical migration.</li> <li>Added information to clarify that RLDRAM3 support uses hard PHY with soft memory controller.</li> <li>Added variable precision DSP blocks support for floating-point arithmetic.</li> </ul> |
| June 2014     | 2014.06.19 | Updated number of dedicated I/Os in the HPS block to 17.   |
| February 2014 | 2014.02.21 | Updated transceiver speed grade options for GT devices in Figure 2.  |
| February 2014 | 2014.02.06 | Updated data rate for Arria 10 GT devices from 28.1 Gbps to 28.3 Gbps.   |
| December 2013 | 2013.12.10 | <ul style="list-style-type: none"> <li>Updated the HPS memory standards support from LPDDR2 to LPDDR3.</li> <li>Updated HPS block diagram to include dedicated HPS I/O and FPGA Configuration blocks as well as repositioned SD/SDIO/MMC, DMA, SPI and NAND Flash with ECC blocks .</li> </ul>   |
| December 2013 | 2013.12.02 | Initial release.   |
